Message:

Our organization, Northrop Grumman Corporation, has an integrated Command and Control (C2) software product named Magnum. Magnum provides a geo-located visual display presentation that shows real time security breaches on a map and manages the assessment of those incidents using cameras and long range imagers.

As part of Magnum's ongoing development, our organization is constantly evaluating and integrating new sensors, including the radars identified in this license application, to detect and track security breaches and new cameras to assess those incidents. To accomplish this, research and experimentation is required to assess the performance and manageability of our integrated security system (consisting of C2 software suite, sensors, assessment devices, network components, etc.) to support and advance the mission of our warfighters and the protection of our critical infrastructures.
