Hi Carl,

Here is the information you requested.

Where are we heading for after testing.

This project, funded by the Department of Homeland Security (DHS), is for an experimental security architecture targeted to support protection of the Transportation Security Administration (TSA). The intent of using the 1.9 GHz frequency range is to test and implement an immediate solution with available commercial equipment until such time that alternative frequency band arrangements can be made for a permanent solution. The 2.5 GHz band is under consideration since some local government entities hold licenses in this region.

If you have any questions, please let me know.

Thanks,

Dong Shin
Engineer II
