

**Proposal for Expedited Filing
of OptimERA Inc.'s
Experimental Licensing Application**

OptimERA requests that its Experimental licensing be reviewed and issued as soon as possible.

The need for OptimERA to secure its experimental license is paramount in increasing our National Security. There are currently projects proposed by, and funding available from the Department of Homeland Security (DHS) to increase the safety of container ships coming in and out of US ports. By issuing OptimERA their requested experimental license in an expedited manner, OptimERA can begin to immediately pursue government and venture capital funding to increase the security of our Homeland through better telecommunications for the maritime industry.

The ability to have inexpensive high bandwidth communications at sea increases the scope and magnitude of the DHS's Container Safety and Inspection project (SAFECON). Our mobile mesh network would increase safety of the vessels, thereby ensuring container safety. There is also the opportunity to develop a central, confidential database that would gather and hold information collected from various sources via radars in the mesh network, and would be accessible only by the DHS. Tracking suspect ships and identifying their exact location would be fast and simple. The available high bandwidth provides an all new solution to provide the robust structure necessary to support the next paradigm shift in maritime security communications. With OptimERA's experimental license the ability to test these new solutions and concepts is possible.
