Application Narrative for Proposed Equipment

Proposed Program

Pegasus Technologies is a leading company in RDT&E of specialized aircraft equipment and systems. We have a wide variety of clients spanning the private sector, including many military defense contractors. The experimental work we conduct almost always requires a GPS signal. The GPS repeater system will provide us the needed signal (attenuated and rebroadcasted within the range allowed by NTIA 8.3.28) indoors to further design and develop our GPS applications and integrations.

The repeater system is crucial for us to continue supplying top-of-line products to our customers who depend on us for innovative aerial solutions.
