

We would like to test some new equipment from Ilevio at our trial sites. This would be the first time that Ilevio would be used in the US. They use the DS2 chipset so we would apply the proper power masking and notching. It would include a variety of gateways and couplers including the following model numbers of gateways and repeaters ILV2010, 2015, 2115, 2110, 2120 and 2125. It would include the following capacitive couplers – CC1 and CC3 and the following inductive couplers IC1, 2, 3 and 6.
