

Statement of Modification Requested

Applicant applied for and was granted on August 3, 2005, an Experimental License, call sign WD2XTB. This Experimental License authorizes uses pursuant to Section 5.3 (d, e, g, and i) of the Commission's rules.

Applicant has been approached by several entities that wish to test the feasibility of the Raysat mobile broadband Ku-Band platform in the field as part of a limited market study as permitted by Section 5.93 of the Commission's rules. Such market study will conform in all respects to the requirements of this Rule. Applicant therefore respectfully requests that the experimental license be amended to add Section 5.3(j) to the operations permitted under the license.

The market study will be overseen by Raysat engineers. The total number of terminals to be used in the market study is approximately 90. The participants in the market study will be U.S. military and other U.S. government agencies, state and local emergency first responder agencies, VSAT service vendors, and recreational vehicle equipment manufacturers.

Applicant does not request any additional modifications to the license. All parameters of the license as granted, including the expiration date of August 1, 2007, will otherwise remain unchanged and unaffected.

Because the Raysat platform offers a valuable service -- mobile broadband -- that is not currently available in the United States, and the limited market studies that will be conducted pursuant to the modification sought herein will help advance the development of the product and the service, Raysat submits that the grant of the requested limited modification is in the public interest.
