

EXHIBIT No. 1

SAIC is under contract (DAAB07-98-D-H752) to the U.S. Army (Night Vision and Electronic Systems Directorate, Ft. Belvoir) to productize and build several copies of the IUMSS (INSCOM Unattended Sensor System) system which communicate data over an RF link. We are currently developing a next generation system and will be delivering 4 units, including 3 HF radios. We will test the systems before delivery, demonstrate their operation, and will be performing additional testing over the next 2 years on the delivered units. All of these functions will require us to operate the radios occasionally on a random schedule.

The HF radios will be operated locally in the southwestern Ohio area as well as antenna testing over longer ranges.
