

Savi Networks GPS Repeater Experimentation Description for FCC License

Use: Savi Networks will use a GPS repeater inside our building for purposes of system testing of GPS tracking devices.

Objectives: The objectives are to provide a quick and low cost method of testing GPS functions of GPS modules inside our tracking devices. This is necessary since we ship these devices on a leasing basis to customers, and must ensure that the devices are functioning upon return to Savi Networks prior to shipping to the next customer.

Contribution: Savi Networks was formed to improve the efficiency and security of global trade. The importance of Savi Networks' mission is constantly increasing given the challenges, risks, and opportunities of global trade. Our GPS tracking devices monitor the security of shipments with tamper alerting functions, and also provide our customers with visibility of shipment locations to be able to track their goods for optimization of their supply chains.
