Message:

Question:

How is the system selecting a frequency from this frequency band? Is it using preset channels or using a frequency-agile selection

Response:

Available frequencies will be identified by operators on site after a spectrum analyzer sweep. The proposed prototype wireless microphones will be manually tuned, and are not enabled for automated frequency-agile selection. Proposed experiments will be offset from incumbent spectrum users (identified through ULS) within a 2km radius by a minimum of 100 kHz. For further details on frequency selection please review Exhibit B.

The proposed operations are consistent with permanent Part 74 operations adopted for the 941-960 MHz band in ET Docket 14-166.
