---

Message:

I have submitted a revised ODAR which corrects the errors in our original ODAR submission. The new revision is rev C. Note that when we re-ran the satellite through DAS using the correct parameters, DAS now predicts that no components survive re-entry - including the CO2 cartridge. We suspect that in previous runs, the cartridge had been shielded by the balloon box, which was incorrectly modelled as stainless steel. Now that we've entered the correct material, the entire assembly vaporizes at high altitude.

Please confirm when you have received the revised ODAR rev C for SkyCube.
