

Exhibit 7

Necessary Bandwidth Description

The maximum modulation bandwidth proposed for upstream and downstream transmissions is 14.0 MHz. The modulation and emissions meet the requirements specified in Part 90 and those specified in Report and Order (ET Docket No. 04-151) to avoid interference to other authorized users.

Test will be conducted using 14 MHz-wide channels in the 3650-3700 bands. StarTouch does not anticipate using the entire band for regular service, StarTouch will test throughout the band for testing propagation characteristics and confirm any interference from adjacent frequencies.
