

EXHIBIT 001

We are currently developing PACS (Personal Access Communications System) RPCU (Radio Port Control Unit) following the T1P1.3 PACS Air Interface Standard. Our RPCU is capable of linking multiple RP (Radio Port) and make voice or data communication by using PACS SU (Subscriber Unit) through RP and RPCU to other SU or wireline telephone.

Multiple RP will be installed in our laboratory and connected to our RPCU. RPCU will perform RF (Radio Frequency) link quality measurement by measuring the RSSI (Radio Signal Strength Indication), QI (Quality Indication) and WEI (Word Error Indication) to monitor the RP's RF performance.

ALT (Automatic Link Transfer) between RPs are performed and monitored under the command of the RPCU to ensure smooth handoff from one RP to another RP when the SU is travelling from one RP's coverage area to another RP' coverage area.
