

EXPERIMENTAL LICENSE

Thales Communications designs and manufactures military and public safety radio products. Thales desires experimental license for the listed frequencies for test and verification purposes. Current FCC and NTIA governed equipment that we produce are tested within twenty one miles radius. The devices do not transmit constantly or remain in use.

Please note that the use of the requested license would be secondary to any currently license-coordinated or authorized users in the frequency bands. Test and verification is of the products is required to ensure the products manufactured are within FCC, NTIA, and other required specifications as applicable functional and performance requirements. Use of these frequencies for test and verification purposes is within the standardized test plans to provide us with quantitative and traceable results. Although some of the frequencies requested are not commonly used by public safety agencies, our radio is type-accepted and is used by agencies that are authorized in the entire frequency range.
