Question 1.

Are the emission designators for all the antennas 50M0A3N and N0N? If so, do you authorize me to amend this application to reflect the same?

Response 1.

As noted in the technical description, we believe the correct emission designator for a spread-spectrum signal that is a maximum of 50 MHz wide and analog modulated by Gaussian Noise that does not contain any information to be 50M0A3N. If this is the correct designator, please apply to all antennas. If this is not the correct designator please apply the correct designator to all antennas.

In addition to the spread-spectrum emission designator, please apply N0N to all antennas.

Thank you,

Chuck Zappala
