Exhibit 2

Boeing is required to test the VHF radios that are installed on commercial aircraft. The requirement states that the radios must work throughout the band. Presently we have frequencies that cover the low and mid parts of the band. We are requesting one frequency somewhere between 134 and 137 MHz to test the high end of the band. These tests will only be done when a new model of radio is used or if it is put into another aircraft.

The test consists of the aircraft flying out 160 nm, then flying a circle and testing every 10 degrees.
