Message:

The purpose of this testing is show compliance to various EU Standards. Specifically Radiated Immunity. We are using very low power to achieve these requirements. All equipment is too large to fit into an anechoic chamber so we are forced to travel to the customer facility to perform these tests. At each location listed we will only be transmitting for no more than 2 hours. Within the next 6 months I have listed on the application all the locations we will need to perform this testing. Also note that all testing will be done indoors (industrial factories).

The testing procedure is as follows per the standard:

1400 ? 2000MHz 3V/m with a 1kHz 80%AM Modulation

2000 ? 2700 1V/m with a 1kHz 80%AM Modulation

We use a 1% step size and dwell at each frequency for 2 seconds vertical and horizontal.

I of course will only transmit in the ranges you grant me permission.
