

NARRATIVE STATEMENT

Time Warner Cable has invested in a wireless mobile broadband product offering. In its effort to provide the best possible service to its customers, TWC Wireless LLC ("TWC") needs to perform various tests with devices and applications in an un-tethered environment. These tests are intended to support system, application and device development, as well as quality assurance.

TWC's applications are intended to operate in mobile environments, so an adequate test system cannot be limited to a single room (*e.g.*, an RF containment chamber).

To support this requirement, TWC will purchase and install FCC certified WiMAX (IEEE 802.16) base station equipment operating in the 2.5GHz band. The base stations and mobile units (devices under test) will be installed indoors. Because TWC requires walking-speed mobility, the system is designed to radiate at low levels throughout the building designated in the accompanying license application.

TWC will perform functional testing on devices intended for commercial offerings and applications that rely on the devices and functionality provided in a mobile network.
