"...What is the expanded current product testing and new product testing? Please giving the details..."

Our primary function here is to design and test communications antennas and feeds. To and provide radiation pattern data in order to verify that we meet industry and federal communication standards. We also design and test the feed systems that are part of these antennas. We would like to widen our currently authorized frequency bands on our current license some to allow us to provide better radiation pattern data for our current products plus we are developing some additional/new antennas and feeds that are higher in frequency; we will require clearance to test those antenna and feed patterns.
