

YOFiMeter is a cellular based blood glucose meter being developed by GadLight for single patient use (not to be used in a hospital setting). The device will use a Sierra Wireless SL8080 certified modem (FCC ID: N7NSL8080) to transmit collected test results (data only, no voice) and transmit to a cloud based server. We will be using AT&T's network exclusively and are building the device with expectations to be certified for their network.

We are seeking an experimental license to support our controlled testing of 250 devices for the next 18 months while we undergo device certifications and approval for FDA. Our forecast is to be in production Q3-Q4 of 2014.
