RF Exposure Letter

Page 1 of 1

According to 447498 D01 General RF Exposure Guidance v06 The 1 - g and 10 - g SAR test

exclusion thresholds for 100 MHz to 6 GHz at test separation distances \leq 50 mm are determined by: [(max. power of channel, including tune - up tolerance, mW)/(min. test separation distance, mm)] • [$\sqrt{f(GHz)}$] \leq 3.0 for 1 - g SAR and \leq 7.5 for 10 - g extremity SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest $\ensuremath{\mathsf{mW}}$ and $\ensuremath{\mathsf{mm}}$ before calculation

The result is rounded to one decimal place for comparison

pt=-1.71dBm=0.6745mW at 2402MHz

So $(0.6745 \text{mW/5mm})x \sqrt{2.402 \text{GHz}} = 0.2091 < 3$

Then SAR evaluation is not required
