

Hearing Aid Compatibility (HAC) RF Emissions Test Report

APPLICANT	: COOSEA GROUP (HK) COMPANY LIMITED
PRODUCT NAME	: LTE Smartphone
MODEL NAME	: SL100EA
BRAND NAME	: Cricket
FCC ID	: 2A28USL100EA
STANDARD(S)	: FCC 47 CFR Part 20(20.19) ANSI C63.19-2011
RECEIPT DATE	: 2021-10-29
TEST DATE	: 2021-11-11
ISSUE DATE	: 2022-01-13

Edited by:

1. Attestation of Testing Summary

Air Interface	Frequency Band	E-field M-Rating	
	LTE Band 2	M4	
	LTE Band 4	M4	
	LTE Band 5	M4	
VoLTE	LTE Band 12	M4	
	LTE Band 14	M4	
	LTE Band 30	M4	
	2.4GHz	M4	
VoWi-Fi	5GHz	M4	

Note:

1. It is compliance with HAC limits for this device that specified in FCC 47 CFR Part 20.19 and ANSI C63.19.

2. When the test result is a critical value, we will use the measurement uncertainty give the judgment result based on the 95% confidence intervals.

2.1. Applicant and Manufacturer Information

Applicant:	COOSEA GROUP (HK) COMPANY LIMITED
Applicant Address:	UNIT 5-6 16/F MULTIFIELD PLAZA 3-7A PRAT AVENUE TSIMSHATSUI KL, HONG KONG, CHINA
Manufacturer:	COOSEA GROUP (HK) COMPANY LIMITED
Manufacturer Address:	UNIT 5-6 16/F MULTIFIELD PLAZA 3-7A PRAT AVENUE TSIMSHATSUI KL, HONG KONG, CHINA

2.2. Equipment under Test (EUT) Description

Product Name:	LTE Smartphone		
IMEI:	353497700011035		
Hardware Version:	1.0		
Software Version:	SL100EAC010001		
Frequency Bands:	LTE Band 2: 1850 MHz ~ 1910 MHz		
	LTE Band 4: 1710 MHz ~ 1755 MHz		
	LTE Band 5: 824 MHz ~ 849 MHz		
	LTE Band 12: 699 MHz ~ 716 MHz		
	LTE Band 14: 788 MHz ~ 789 MHz		
	LTE Band 30: 2305 MHz ~ 2315 MHz		
	WLAN 2.4GHz: 2412 MHz ~ 2462 MHz		
	WLAN 5.2GHz: 5180 MHz ~ 5240 MHz		
	WLAN 5.3GHz: 5260 MHz ~ 5320 MHz		
	WLAN 5.5GHz: 5500 MHz ~ 5700 MHz		
	WLAN 5.8GHz: 5745 MHz ~ 5825 MHz		
	Bluetooth: 2402 MHz ~ 2480 MHz		
Modulation Mode:	LTE: QPSK, 16QAM, 64QAM		
	802.11b: DSSS		
	802.11g/n-HT20/40: OFDM		
	802.11a/ac-VHT20/40/80: OFDM		
	Bluetooth: GFSK(1Mbps), π/4-DQPSK(2Mbps), 8-DPSK(3Mbps)		
VoLTE:	Support		
Antenna Type:	WWAN: PIFA Antenna		
	WLAN: PIFA Antenna		
	Bluetooth: PIFA Antenna

3. RF Audio Interference Level

FCC wireless hearing aid compatibility rules ensure that consumers with hearing loss are able to access wireless communications services through a wide selection of handsets without experiencing disabling radio frequency (RF)interference or other technical obstacles. To define and measure the hearing aid compatibility of handsets, in CFR47 part 20.19 ANSI C63.19 is referenced.

A handset is considered hearing aid-compatible for acoustic coupling if it meets a rating of at least M3 under ANSI C63.19, and A handset is considered hearing aid compatible for inductive coupling if it meets a rating of at least T3. According to ANSI C63.19 2011 version, for acoustic coupling, the RF electric field emissions of wireless communication devices should be measured and rated according to the emission level as below.

Emission Cotogorios	E-field Emissions		
Emission Categories	<960MHz	>960MHz	
M1	50 to 55 dB (V/m)	45 to 50 dB (V/m)	
M2	45 to 50 dB (V/m)	35 to 40 dB (V/m)	
M3	40 to 45 dB (V/m)	30 to 35 dB (V/m)	
M4	<40 dB (V/m)	<30 dB (V/m)	

Table 3.1 WD RF audio Interference level categories in logarithmic units

Table 3.2 System performance classification table		
System algoritization	Category sum	
System classification	Hearing aid category + telephone category	
Usable	Hearing aid category + telephone category = 4	
Normal use	Hearing aid category + telephone category = 5	
Excellent performance	Hearing aid category + telephone category = ≥6	

Table 3.2 System performance classification table

4. Air Interface and Operating Mode

Air Interface	Band	Transport Type	Simultaneous Transmitter	Name of Voice Service	Power Reduction
	Band 2		Wi-Fi & BT	VoLTE & Google duo	No
	Band 4	VD			No
FDD-LTE	Band 5				No
FDD-LIE	Band 12				No
	Band 14				No
	Band 30				No
	2450				No
Wi-Fi	5200 (U-NII-1)	VD	LTE	VoWiFi	No
	5300 (U-NII-2A)			&	No
	5500 (U-NII-2C)			Google duo	No
	5800 (U-NII-3)				No
BT	2450	DT	LTE	N/A	No

Where:

VO=Voice Only

DT=Digital Transport only

VD=CMRS and IP Voice Service over Digital Transport

BT=Bluetooth

* Ref Lev in accordance with 7.4.2.1 of ANSI C63.19-2011 and the July 2012 VoLTE interpretation

** Ref Lev -20 dBm0

*** Ref Lev XYNet established by KDB Inquiry NNNNNN @ -16 dBm0

Note:

- 1) Air Interface/Band MHz: List of all air interfaces and bands supported by the handset.
- 2) Type: For each air interface, indicate the type of voice transport mode:
 - i. VO = legacy Cellular Voice Service, from Table 7.1 in 7.4.2.1 of ANSI C63.19-2011;
 - ii. DT = Digital Transport only (no voice);
 - iii. VD = IP Voice Service over Digital Transport.
- **3)** Simultaneous Transmitter: Indicate any air interface/bands that operate in simultaneous or concurrent service transmission mode.
- 4) Name of Voice Service: See Q4 in 285076 D03 HAC FAQ for further clarification.
- a) Ref Lev in accordance with 7.4.2.1 of ANSI C63.19-2011 and the July 2012 VoLTE interpretation

5. Modulation Interference Factor

The HAC Standard ANSI C63.19-2011 defines a new scaling using the Modulation Interference Factor (MIF). For any specific fixed and repeatable modulated signal, a modulation interference factor (MIF, expressed in dB) may be developed that relates its interference potential to its steady-state rms signal level or average power level.

This factor is a function only of the audio-frequency amplitude modulation characteristics of the signal and is the same for field-strength and conducted power measurements. It is important to emphasize that the MIF is valid only for a specific repeatable audio-frequency amplitude modulation characteristic. Any change in modulation characteristic requires determination and application of a new MIF.

The Modulation Interference factor (MIF, in dB) is added to the measured average E-field (in dBV/m) and converts it to the RF Audio Interference level (in dBV/m). This level considers the audible amplitude modulation components in the RF E-field. CW fields without amplitude modulation are assumed to not interfere with the hearing aid electronics. Modulations without time slots and low fluctuations at low frequencies have low MIF values, TDMA modulations with narrow transmission and repetition rates of few 100 Hz have high MIF values and give similar classifications as ANSI C63.19-2011. ER3D, EF3D and EU2D E-field probes have a bandwidth <10 kHz and can therefore not evaluate the RF envelope in the full audio band. DASY52 is therefore using the indirect measurement method according to ANSI C63.19-2011 which is the primary method. These near field probes read the averaged E-field measurement. Especially for the new high peak-to-average (PAR) signal types, the probes shall be linearized by PMR calibration in order to not overestimate the field reading. Probe Modulation Response (PMR) calibration linearizes the probe response over its dynamic range for specific modulations which are characterized by their UID and result in an uncertainty specified in the probe calibration certificate. The MIF is characteristic for a given waveform envelope and can be used as a constant conversion factor if the probe has been PMR calibrated. The evaluation method for the MIF is defined in ANSI C63.19-2011 section D.7. An RMS demodulated RF signal is fed to a spectral filter (similar to an A weighting filter) and forwarded to a temporal filter acting as a quasi-peak detector. The averaged output of these filtering is scaled to a 1 kHz 80% AM signal as reference. MIF measurement requires additional instrumentation and is not well suited for evaluation by the end user with reasonable uncertainty. It may alliteratively be determined through analysis and simulation, because it is constant and characteristic for a communication signal. DASY52 uses well-defined signals for PMR calibration. The MIF of these signals has been determined by simulation and it is automatically applied. The MIF measurement uncertainty is estimated as follows, declared by HAC equipment provider SPEAG, for modulation frequencies from slotted waveforms with fundamental frequency and at least 2 harmonics within 10 kHz:

0.2 dB for MIF	0.5 dB for MIF	1 dB for MIF
-7dB to +5 dB	-13dB to +11 dB	> -20 dB

MIF values applied in this test report were provided by the HAC equipment provider of SPEAG, and the worst values for all air interface are listed below to be determine the Low-power Exemption.

SHENZHEN MORLAB COMMUNICATIONS TECHNOLOGY Co., Ltd. FL1-3, Building A, FeiYang Science Park, No.8 LongChang Road, Block67, BaoAn District, ShenZhen , GuangDong Province, P. R. China Tel: 86-755-36698555 Http://www.morlab.cn Fax: 86-755-36698525

Remake: The output power of LTE/WLAN is derived from the report W7L-P21100025RF02~03.

7. Low-power Exemption

Air Interface	Max Tune-up Limit (dBm)	Worst Case MIF (dB)	Power + MIF(dB)	C63.19 Test Required
LTE Band 2	25.0	-15.63	9.37	No
LTE Band 4	25.0	-15.63	9.37	No
LTE Band 5	25.0	-15.63	9.37	No
LTE Band 12	25.0	-15.63	9.37	No
LTE Band 14	25.0	-15.63	9.37	No
LTE Band 30	25.0	-15.63	9.37	No
WLAN 2.4GHz 802.11b	19.0	-2.02	16.98	No
WLAN 2.4GHz 802.11g	17.0	-0.12	16.82	No
WLAN 2.4GHz 802.11n	14.0	-13.44	0.56	No
WLAN 5GHz 802.11a	17.0	-3.15	13.85	No
WLAN 5GHz 802.11n	16.0	-3.15	12.85	No
WLAN 5GHz 802.11ac	15.0	-5.57	9.43	No

Note:

- According to ANSI C63.19 2011-version, for the air interface technology of a device is exempt from testing when its average antenna input power plus its MIF is ≤17 dBm for any of its operating modes.
- 2. For all of bands, the worst case of maximum tune-up limit will be test RF emission, therefore WLAN and FDD-LTE mode is not necessary for testing.
- 3. HAC RF rating is **M4** for the air interface which meets the low power exemption.

8. Uncertainty Assessment

The component of uncertainly may generally be categorized according to the methods used to evaluate them. The evaluation of uncertainly by the statistical analysis of a series of observations is termed a Type evaluation of uncertainty. The evaluation of uncertainty by means other than the statistical analysis of a series of observation is termed a Type B evaluation of uncertainty. Each component of uncertainty, however evaluated, is represented by an estimated standard deviation, termed standard uncertainty, which is determined by the positive square root of the estimated variance.

The combined standard uncertainty of the measurement result represents the estimated standard deviation of the result. It is obtained by combining the individual standard uncertainties of both Type A and Type B evaluation using the usual "root-sum-squares" (RSS) methods of combining standard deviations by taking the positive square root of the estimated variances. Expanded uncertainty is a measure of uncertainty that defines an interval about the measurement result within which the measured value is confidently believed tolie. It is obtained by multiplying the combined standard uncertainty by a coverage factor. For purpose of this document, a coverage factor two is used, which corresponds to confidence interval of about 95 %. The DASY uncertainty Budget is showed in Table 12.1.
