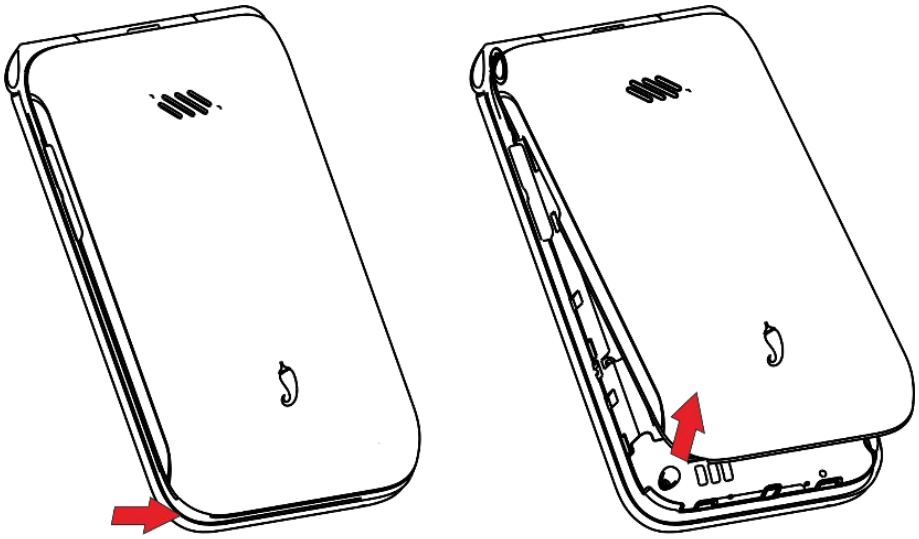
1.2 Setting up your phone

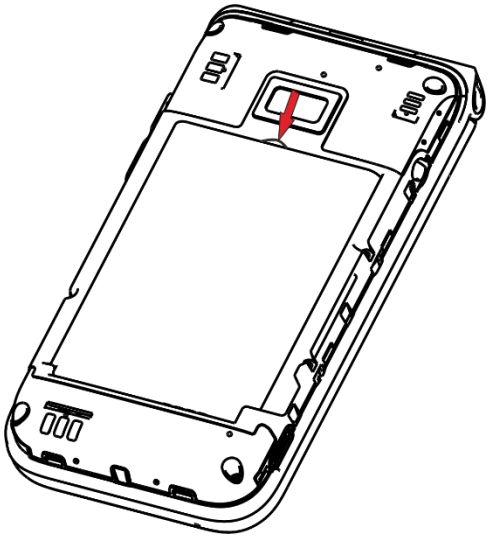
Your phone actually doesn't have any NANO SIM card installed. MicroSD cards (up to 128GB) excluded as well.

NOTE: Power off the device before opening the back cover to install a microSD or replace the NANO SIM card.

Step 1. With the device facing down, remove the back cover from the bottom left corner. Use your fingernail to carefully lift the cover away from the device body.

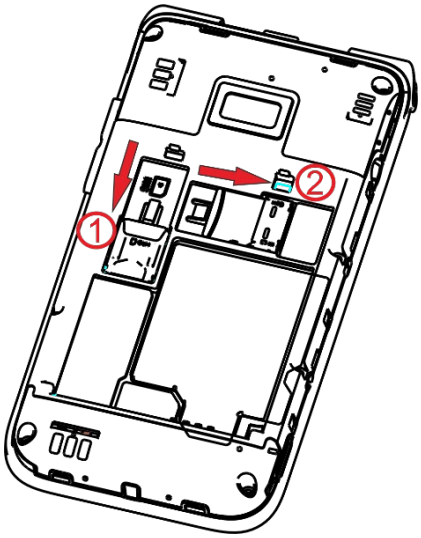


Step 2. Remove the battery using your fingernail to lift from the top.

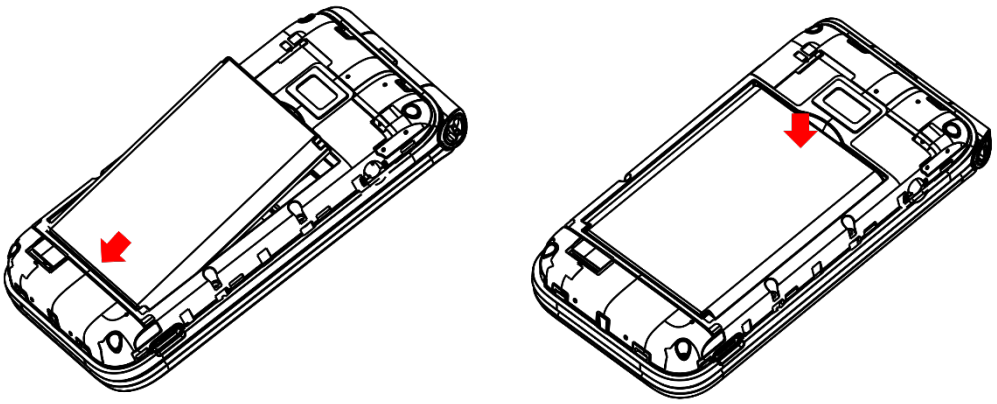


Step 3. To insert SIM card or microSD card, push the SIM card or microSD card into the card slot with the gold-colored contacts facing down.

To remove the SIM card or microSD card, press down on the small plastic tab, then slide out the card. Do not use force or any sharp objects.

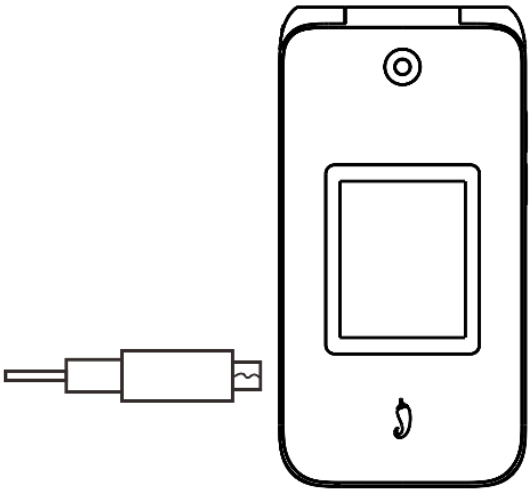


Step 4. Re-install the battery by aligning the gold contact points of the battery with the gold contact points of the cave. It only fits one way. Press down to snap in place.



Step 5. Carefully align the back cover with tabs and press into place. It only fits one direction.

Step 6. Charge your phone fully before turning it on and starting the set-up



process.
WARNING: Only use the charger and cable supplied with the phone. Using incompatible chargers or tampering with the charging port could damage your phone.

1.3 Power on your phone

Press and hold the **End/Power Key** until the phone powers on.
Setup your phone for the first time

The first time you power on the phone, you will be guided through the following few steps. All the setting you didn't see can be done in Setting personally:

- Select the phone's language, then press the **Right Soft Key** to go to the next step.
- Then enter the home screen.

Note: Even if no SIM card is installed, your phone will still power on and you will be able to connect to a Wi-Fi network and use some of the phone's features.

1.4 Power off your phone

Press and hold the **End/Power Key** until the phone has a vibration and then device power off immediately.

11 Safety and Precautions

11.1 Device Precautions

a) This mobile phone is well designed with fine art. Please exercise special care when using it. The following suggestions will help your mobile phone survive the warranty period and extend its service life:
b) Keep the mobile phone and all its fittings beyond children's reach.
c) Keep the mobile phone dry. Keep away from rain, moisture, liquid or other substances that may corrode electronic circuits.
d) Do not use or store the mobile phone in dusty place, lest those active parts of the mobile phone be damaged.
e) Do not store the mobile phone in a high-temperature place. High temperature will shorten the life of electronic circuits and damage the battery and some plastic parts.
f) Do not store the mobile phone in a chilly place. Otherwise, moistures will be formed inside the mobile phone to damage electronic circuits when the mobile phone is moved to a constant temperature place.
g) Do not throw, knock or shock the mobile phone, as that will destroy the internal circuits and high-precision components of the mobile phone.
h) Do not puncture, disassemble or cause a short-circuit in a battery.

i) Do not burn or dispose of a used battery in household rubbish or store it at temperatures above 60℃
j) The operating temperature for the phone is 14°F (-10℃) to 131°F (55℃). The charging temperature for the phone is 32°F (0℃) to 104°F (40℃)

11.2 Battery Precautions

a) Do not disassemble or open crush, bend or deform, puncture or shred
b) Do not modify or remanufacture, attempt to insert foreign objects into the battery, immerse or expose to water or other liquids, expose to fire, explosion or another hazard.
c) Only use the battery with a charging system that has been qualified with the system per CTIA Certification Requirements for Battery System Compliance to IEEE 1725. Use of an unqualified battery or charger may present a risk of fire, explosion, leakage, or another hazard.
d) Replace the battery only with another battery that has been qualified with the system per this standard, IEEE-Std-1725. Use of an unqualified battery may present a risk of fire, explosion, leakage or another hazard.
e) Promptly dispose of used batteries in accordance with local regulations
f) Avoid dropping the phone or battery. If the phone or battery is dropped, especially on a hard surface, and the user suspects damage, take it to a service center for inspection.
g) Improper battery use may result in a fire, explosion or other hazard.

11.3 FCC Notice and Cautions

This device and its accessories comply with Part 15 of FCC Rules.Operation is subject to the following conditions:

a) This device and its accessories may not cause harmful interference.
b) This device and its accessories must accept any interference received, including interference that maycause undesired operation.

Part 15.21 Statement:

Changes or modifications that are not expressly approved by the manufacturer could void the user'sauthority to operate the equipment.

Part of Statement 15.105:

This equipment has been tested and found to comply with the limits for a class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequencyenergy and, if not installed and used in accordance with the instructions, may cause harmful interferenceto radio communications. However, there is no guarantee that interference will not occur in a particular installation. If you experience interference with reception (e.g., television), determine if this equipment is
causing the harmful interference by turning the equipment off and then back on to see if the interferenceis affected.

If necessary, try correcting the interference by one or more of the following measures:

-Reorient or relocate the receiving antenna.

-Increase the separation between the equipment and receiver.
-Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
-Consult the dealer or an experienced radio/TV technician for further assistance.

11.4 Consumer Information on SAR

This Model Phone Meets the Government's Requirements for Exposure to Radio Waves. Your wireless phone is a radio transmitter and receiver. It is designed and manufactured not to exceed the emission limits for exposure to radiofrequency (RF) energy set by the Federal Communications Commission (FCC) of the U.S. Government. These FCC exposure limits are derived from the recommendations of two expert organizations, the National Council on Radiation Protection and Measurement (NCRP) and the Institute of Electrical and Electronics Engineers (IEEE). In both cases, the recommendations were developed by scientific and engineering experts drawn from industry, government, and academia after extensive reviews of the scientific literature related to the biological effects of RF energy. The exposure limit for wireless mobile phones employs a unit of measurement known as the Specific Absorption Rate, or SAR. The SAR is a measure of the rate of absorption of RF energy by the human body expressed in units ofwatts per kilogram (W/kg). The FCC requires wireless phones to comply with a safety limit of 1.6 watts per kilogram (1.6 W/kg). The FCC exposure limit incorporates a substantial margin of safety to give additional protection to the public and to account for any variations in measurements. Tests for SAR are conducted using standard operating positions specified by the FCC with the phone transmitting at its highest certified power level in all tested frequency bands. Although SAR is determined at the highestcertified power level, the actual SAR level of the phone while operating can be well below the maximum value. Because the phone is designed to operate at multiple power levels to use only the power required to reach the network, generally, the closer you are to a wireless base station antenna, the lower the power output. Before a phone model is available for sale to the public, it must be tested and certified tothe FCC that it does not exceed the limit established by the government adopted requirement for safe exposure. The tests are performed in positions and locations (e.g., at the ear and worn on the body) asrequired by the FCC for each model. This device was tested for typical body-worn operations with theback of the phone kept 0.39 inches (1.0 cm) between the user's body and the back of the phone. To comply with FCC RF exposure requirements, a minimum separation distance of 0.39 inches (1.0 cm) must be maintained between the user's body and the back of the phone. Third-party belt clips, holsters, and similar accessories containing metallic components should not be used.

Body-worn accessories that cannot maintain 0.39 inches (1.0 cm) separation distance between the user'sbody and the back of the phone, and have not been tested for typical body-worn operations may not comply with FCC RF exposure limits and should be avoided.

The FCC has granted an Equipment Authorization for this model phone with all reported SAR levelsevaluated as in compliance with the FCC RF emission guidelines.

The highest SAR value for this model phone when tested for use at the head is **1.084 W/kg** and when worn on the body, as described in this user's manual, is **1.189 W/kg**. While there may be differences between SAR levels of various phones and at various positions, they all meet the government requirement for safe exposure. SAR information on this model phone is on file with the FCC and can be found under the Display Grant section of http://www.fcc.gov/oet/ea/fccid/ after searching on FCC ID: 2A33N-L62A.To find information that pertains to a particular model phone, this site uses the phone FCC ID number which is usually printed somewhere on the case of the phone. Sometimes it may be necessary to remove the battery pack to find the number. Once you have the FCC ID number for your phone, follow the instructions on the website and it should provide values for typical or maximum SAR for that phone.

Additional information on Specific Absorption Rates (SAR) can be found on the Cellular Telecommunications Industry Association (CTIA) website at http://www.ctia.org/

In the United States and Canada, the SAR limit for mobile phones used by the public is 1.6 watts/kg (W/kg) averaged over one gram of tissue. The standard incorporates a substantial margin of safety to give additional protection for the public and to account for any variations in measurements.

11.5 FCC Hearing-Aid Compatibility (HAC) Regulations for Wireless Devices

This device has been tested and rated for use with hearing aids, with some of the wireless technologiesthat it uses. However, there may be newer wireless technologies used in the device that have not been tested yet for use with hearing aids. It is important to try the different features on your device thoroughlyand in different locations whilst using a hearing aid or cochlear implant to determine if there is any interfering noise.
The FCC has adopted HAC rules for digital wireless phones. These rules require certain devices to be
tested and rated under the American National Standard Institute (ANSI) C63.19-2011 hearing aid compatibility standards. The ANSI standard for hearing aid compatibility contains two types of ratings:

- M-Ratings: Phones rated M3 or M4 meet FCC requirements and are likely to generate less interference to hearing devices than mobile devices that are not labelled. M4 is the better/higherof the two ratings.
- T-Ratings: Phones rated T3 or T4 meet FCC requirements and are likely to work better with a hearing device's telecoil ("T Switch" or "Telephone Switch") than unrated phones. T4 is the better/higher of the two ratings. (Note not all hearing devices have telecoils in them.)
- The tested M-Rating and T-Rating for this device are **M4** and **T4**.
