FCC RF Exposure Evaluation

1. Product Information

| FCC ID | 2A46K-VHRP-1300 |
|-------------------|---|
| Product Name | 5-IN-1 TURNTABLE SYSTEM |
| Test Model | VHRP-1300 |
| Power supply: | DC 9V comes from the adapter |
| Adapter: | MODEL:HSTF-0900600 |
| | INPUT:100-240V~50/60Hz 0.25A Max |
| | OUTPUT:9V===600mA |
| Modulation Type | Bluetooth: GFSK, π/4DQPSK, 8DPSK |
| Modulation Type | Bluetooth LE: GFSK |
| Antenna Type | PCB Antenna |
| Antenna Gain | -0.68dBi |
| Frequency Range | 2402 – 2480MHz |
| Exposure Category | General population/uncontrolled environment |
| EUT Type | Production Unit |
| Device Type | Mobile Device |

2. Evaluation Method and Limit

Systems operating under the provisions of FCC 47 CFR section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as mobile device whereby a distance of 0.2m normally can be maintained between the user and the device, and below RF Permissible Exposure limit shall comply with.

In accordance with KDB447498D01 for Simultaneous transmission MPE test exclusion applies when the sum of the MPE ratios for all simultaneous transmitting antennas incorporated in a host device, based on the calculated/estimated, numerically modelled or measured field strengths or power density, is $\leqslant 1.0$. The MPE ratio of each antenna is determined at the minimum test separation distance required by the operating configurations and exposure conditions of the host device, according to the ratio of field strengths or power density to MPE limit, at the test frequency. Either the maximum peak or spatially averaged results from measurements or numerical simulations may be used to determine the MPE ratios. Spatial averaging does not apply when MPE is estimated using simple calculations based on far-field plane-wave equivalent conditions. The antenna installation and operating requirements for the host device must meet the minimum test separation distances required by all antennas, in both standalone and simultaneous transmission operations, to satisfy compliance.

 $S=PG/4\pi R^2$

Where: S=power density P=power input to antenna

G=power gain of the antenna in the direction of interest relative to an isotropic radiator R=distance to the center of radiation of the antenna

5. Antenna Information

VHRP-1300 can only use antennas certificated as follows provided by manufacturer;

| Antenna type and antenna number | Operate frequency band | Maximum antenna gain | Note |
|---------------------------------|------------------------|-------------------------|----------------------|
| PCB Antenna | 2402 MHz – 2480 MHz | -0.68dBi | Bluetooth Antenna |

8. Evaluation Results

8.1 Standalone MPE

As declared by the Applicant, the EUT is a wireless device used in a fix application, at least 20 cm from any body part of the user or nearby persons; from the maximum EUT RF output power, the minimum separation distance, r =20cm, as well as the gain of the used antenna refer to antenna information, the RF power density can be obtained.
