4 SAR Evaluation

4.1 RF Exposure Compliance Requirement

4.1.1 Standard Requirement

According to KDB447498D01 General RF Exposure Guidance v06 Standalone SAR test exclusion considerations

Unless specifically required by the published RF exposure KDB procedures, standalone 1-g head or body and 10-g extremity SAR evaluation for general population exposure conditions, by measurement or numerical simulation, is not required when the corresponding SAR Exclusion Threshold condition, listed below, is satisfied.

Limits

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

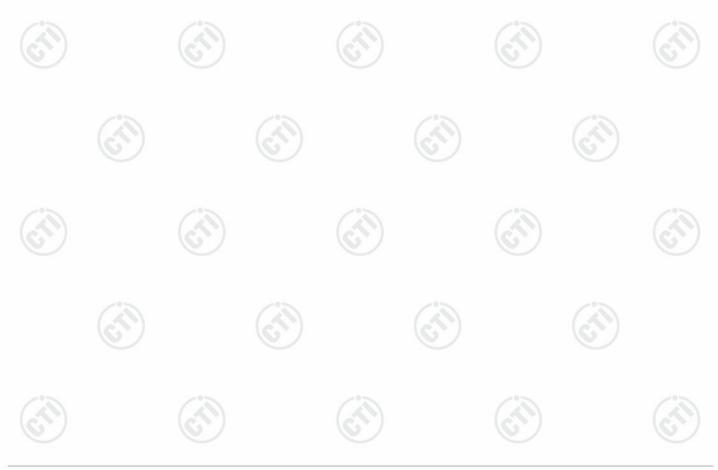

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] $\cdot [\sqrt{f(GHz)}] \le 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation 17

The result is rounded to one decimal place for comparison

The test exclusions are applicable only when the minimum test separation distance is \leq 50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is \leq 5 mm, a distance of 5 mm is applied to determine SAR test exclusion

Report No.:EED32O81225002

4.1.2 EUT RF Exposure

eirp = pt x gt = $(E x d)^2/30$

where:

pt = transmitter output power in watts,

gt = numeric gain of the transmitting antenna (unitless),

E = electric field strength in V/m, ---10 $((dB\mu V/m)/20)/10^6$,

d = measurement distance in meters (m)---3m,

So pt = $(E \times d)^2/30 / gt$

The worst case (refer to report EED32O81225001) is below:

Antenna polarization: Horizontal					
Frequency (MHz)	Level (dBuV/m)	Polarization			
315	90.93	Peak			
315	60.67	Average			

Antenna polarization: Vertical						
Frequency (MHz)	Level (dBuV/m)	Polarization				
315	70.84	Peak				
315	40.58	Average				

For 433.92MHz wireless:

Field strength = 90.93dBµV/m @3m Ant. gain -18dBi; so Ant numeric gain=0.016

So pt= ${[10^{(90.93/20)}/10^6x3]^2/30 /0.016}x1000mW = 23.23mW$

So $(23.23 \text{mW/5mm})x \sqrt{0.315 \text{GHz}} = 2.61$,

2.61<3.0 for 1-g SAR

So the SAR report is not required.
