## 2. Technical Requirements Specification in CFR Title 47 Part 2.1093

#### 2.1. Evaluation method

According to KDB 447498 D01 General RF Exposure Guidance v06, clause 4.3. General SAR test exclusion guidance:

- c) For frequencies below 100 MHz, the following may be considered for SAR test exclusion (also illustrated in Appendix C):
  - 1) For test separation distances > 50 mm and < 200 mm, the power threshold at the corresponding test separation distance at 100 MHz in step b) is multiplied by  $[1 + \log(100/f_{(MHz)})]$
  - 2) For test separation distances  $\leq$  50 mm, the power threshold determined by the equation in c) 1) for 50 mm and 100 MHz is multiplied by  $\frac{1}{2}$
  - 3) SAR measurement procedures are not established below 100 MHz.

#### 2.2. Evaluation Results

Frequency	Field strength	Radiated Power	Conducted power	Exclusion Threshold
(MHz)	$(dB\mu V/m@3m)$	(EIRP)(mW)	(mW)	Level(mW)
13.56	-3.89	0	0	443

#### Notes:

Conducted power = Radiated Power (EIRP) - Antenna Gain.

 $EIRP[dBm] = E[dB\mu V/m] - 95.2 = -3.89dB\mu V/m - 95.2 = -99.09dBm \approx 0mW.$ 

Exclusion Threshold Level =  $[474]*(1+\log(100/f_{(MHz)}))]/2 = 433$ mW.

#### 2.3. Conclusion

Since the source-based time-averaging conducted output power is well below the SAR low threshold level, so the EUT is considered to comply with SAR requirement without testing.

### 3.1. Evaluation method

RSAR evaluation is required if the separation distance between the user and/or bystander and the antenna and/or radiating element of the device is less than or equal to 20 cm, except when the device operates at or below the applicable output power level (adjusted for tune-up tolerance) for the specified separation distance defined in Table 1.
