

## TEST REPORT

**Product** : millimeter wave radar  
**Trade mark** : CHUHANG TECH  
**Model/Type reference** : ARC2.33  
**Serial Number** : N/A  
**Report Number** : EED32Q80639901  
**FCC ID** : 2A7HDARC233  
**Date of Issue** : Jun. 18, 2024  
**Test Standards** : 47 CFR Part 2  
47 CFR Part 95 Subpart M  
**Test result** : PASS

Prepared for:

**Nanjing Chuhang Technology Co., Ltd.**  
**12F, Building A, No. 9, Yunzheng Street Nanjing, China**

Remark:

Company Name and Address shown on Report, the sample(s) and sample Information were provided by the applicant who should be responsible for the authenticity which CTI hasn't verified.

### 3 General Information

#### 3.1 Client Information

|                          |                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Applicant:               | Nanjing Chuhang Technology Co., Ltd.                                                                                          |
| Address of Applicant:    | 12F, Building A, No. 9, Yunzheng Street Nanjing, China                                                                        |
| Manufacturer:            | Nanjing Chuhang Technology Co., Ltd.                                                                                          |
| Address of Manufacturer: | 12F, Building A, No. 9, Yunzheng Street Nanjing, China                                                                        |
| Factory:                 | Anqing Chuhang Electronic Technology Co., Ltd.                                                                                |
| Address of Factory:      | Building 1, New Energy Vehicle Industrial Park, Economic and Technological Development Zone, Anqing, 246000 Anhui, P.R. China |

#### 3.2 General Description of EUT

|                       |                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------|
| Product Name:         | millimeter wave radar                                                                                              |
| Model No.:            | ARC2.33                                                                                                            |
| Trade mark:           | CHUHANG TECH                                                                                                       |
| Product Type:         | <input checked="" type="checkbox"/> Mobile <input type="checkbox"/> Portable <input type="checkbox"/> Fix Location |
| Type of Modulation:   | FMCW(Frequency Modulated Continuous Wave)                                                                          |
| Operating Frequency   | 77.80GHz                                                                                                           |
| Test Power Grade:     | Default                                                                                                            |
| Test Software of EUT: | ChuHangDV1.4.10.exe                                                                                                |
| Antenna Type:         | PCB Antenna                                                                                                        |
| Antenna Gain:         | 11.90dBi                                                                                                           |
| Power Supply:         | DC 9.0V to DC 32.0V                                                                                                |
| Test Voltage:         | DC 24V                                                                                                             |
| Sample Received Date: | Jun. 04, 2024                                                                                                      |
| Sample tested Date:   | Jun. 05, 2024 to Jun. 06, 2024                                                                                     |

### 3.3 Test Environment

| Operating Environment: |            |
|------------------------|------------|
| Temperature:           | 22~25.0 °C |
| Humidity:              | 50~55 % RH |
| Atmospheric Pressure:  | 1010mbar   |

### 3.4 Description of Support Units

The EUT has been tested with associated equipment below.

1) support equipment

| Description | Manufacturer | Model No.   | Certification | Supplied by |
|-------------|--------------|-------------|---------------|-------------|
| Netbook     | HP           | 14-ce0061TX | FCC&CE        | CTI         |

### 3.5 Test Location

All tests were performed at:

Centre Testing International Group Co., Ltd

Building C, Hongwei Industrial Park Block 70, Bao'an District, Shenzhen, China

Telephone: +86 (0) 755 33683668 Fax:+86 (0) 755 33683385

No tests were sub-contracted.

FCC Designation No.: CN1164

### 3.6 Measurement Uncertainty (95% confidence levels, k=2)

| No. | Item                            | Measurement Uncertainty |
|-----|---------------------------------|-------------------------|
| 1   | Radio Frequency                 | $7.9 \times 10^{-8}$    |
| 2   | RF power, conducted             | 0.46dB (30MHz-1GHz)     |
|     |                                 | 0.55dB (1GHz-18GHz)     |
| 3   | Radiated Spurious emission test | 3.3dB (9kHz-30MHz)      |
|     |                                 | 4.3dB (30MHz-1GHz)      |
|     |                                 | 4.5dB (1GHz-18GHz)      |
|     |                                 | 3.4dB (18GHz-40GHz)     |
|     |                                 | 4.62dB (40GHz-60GHz)    |
|     |                                 | 4.80dB (60GHz-90GHz)    |
|     |                                 | 4.90dB (90GHz-140GHz)   |
|     |                                 | 5.11dB (140GHz-220GHz)  |
| 4   | Conduction emission             | 3.5dB (9kHz to 150kHz)  |
|     |                                 | 3.1dB (150kHz to 30MHz) |
| 5   | Temperature test                | 0.64°C                  |
| 6   | Humidity test                   | 3.8%                    |
| 7   | DC power voltages               | 0.026%                  |

## 4 Equipment List

| 3M Semi-anechoic Chamber (2)     |              |             |            |                        |                            |

#### Conclusion

According to § 2.1047, A curve or equivalent data which shows that the equipment will meet the modulation requirements of the rules under which the equipment is to be licensed

Comments from manufacturer on modulation characteristics according to KDB:

| Parameter                  |                                           |
|----------------------------|-------------------------------------------|
| Duty Cycle %:              | 51%                                       |
| Time RF on(ms):            | 51                                        |
| Time RF off(ms):           | 49                                        |
| Power:                     | Constant during RF on                     |
| Steepness of Ramps(GHz/s): | 0.0117                                    |
| Calibration:               | N/A                                       |
| Antenna Beam Steering(TX): | $\pm 50^\circ$                            |
| Characteristics            |                                           |
| Type of Modulation:        | FMCW(Frequency Modulated Continuous Wave) |
| Sweep Width(MHz):          | 468.75                                    |
| Sweep Time( $\mu$ s):      | 67 or 60                                  |
| Chirp Bandwidth(MHz):      | 400                                       |
| Chirp Time( $\mu$ s):      | 40                                        |
| Chirp Rate(MHz/ $\mu$ s):  | 11.718                                    |
| Chirp Length( $\mu$ s):    | 40                                        |

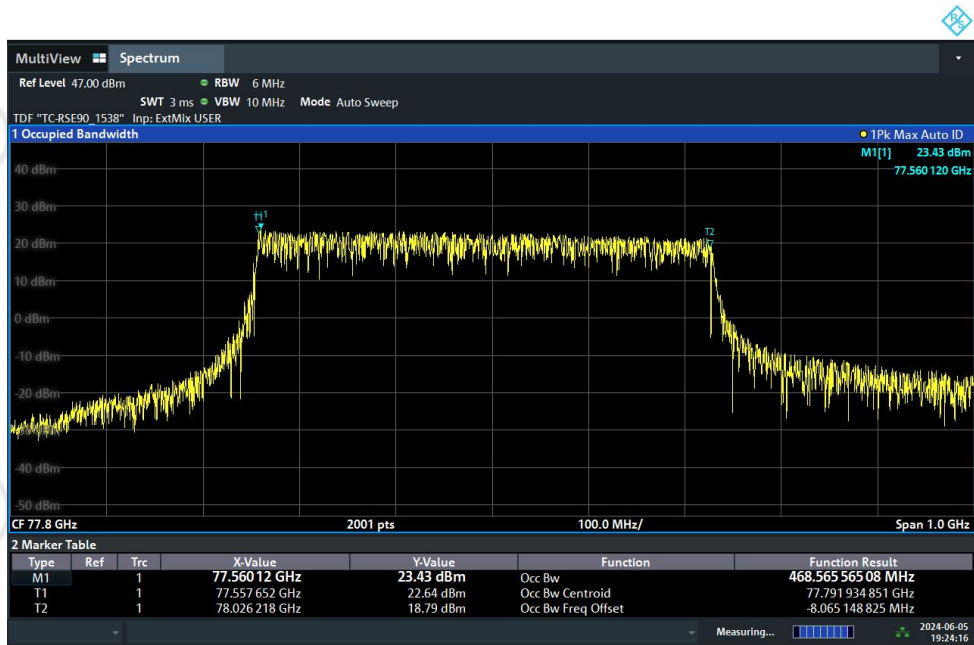

## 5.2 99% Occupied bandwidth

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Remark:**

- ① This is a radiated test, and test distance of 1.0m was used for the fundamental emissions measurement.
- ② EIRP(dBm/MHz) has added free space loss of 1.0m distance.
- ③ The FMCW Chirps Correction Factor was calculated using the formula:

$$CF_{chirp} = 5 * \log \left( 1 + K * \left( \frac{Span}{t * RBW^2} \right)^2 \right)$$

With t being the length of the chirp and K a correction factor for the setting process of the gaussian shaped filter (~0.1947).

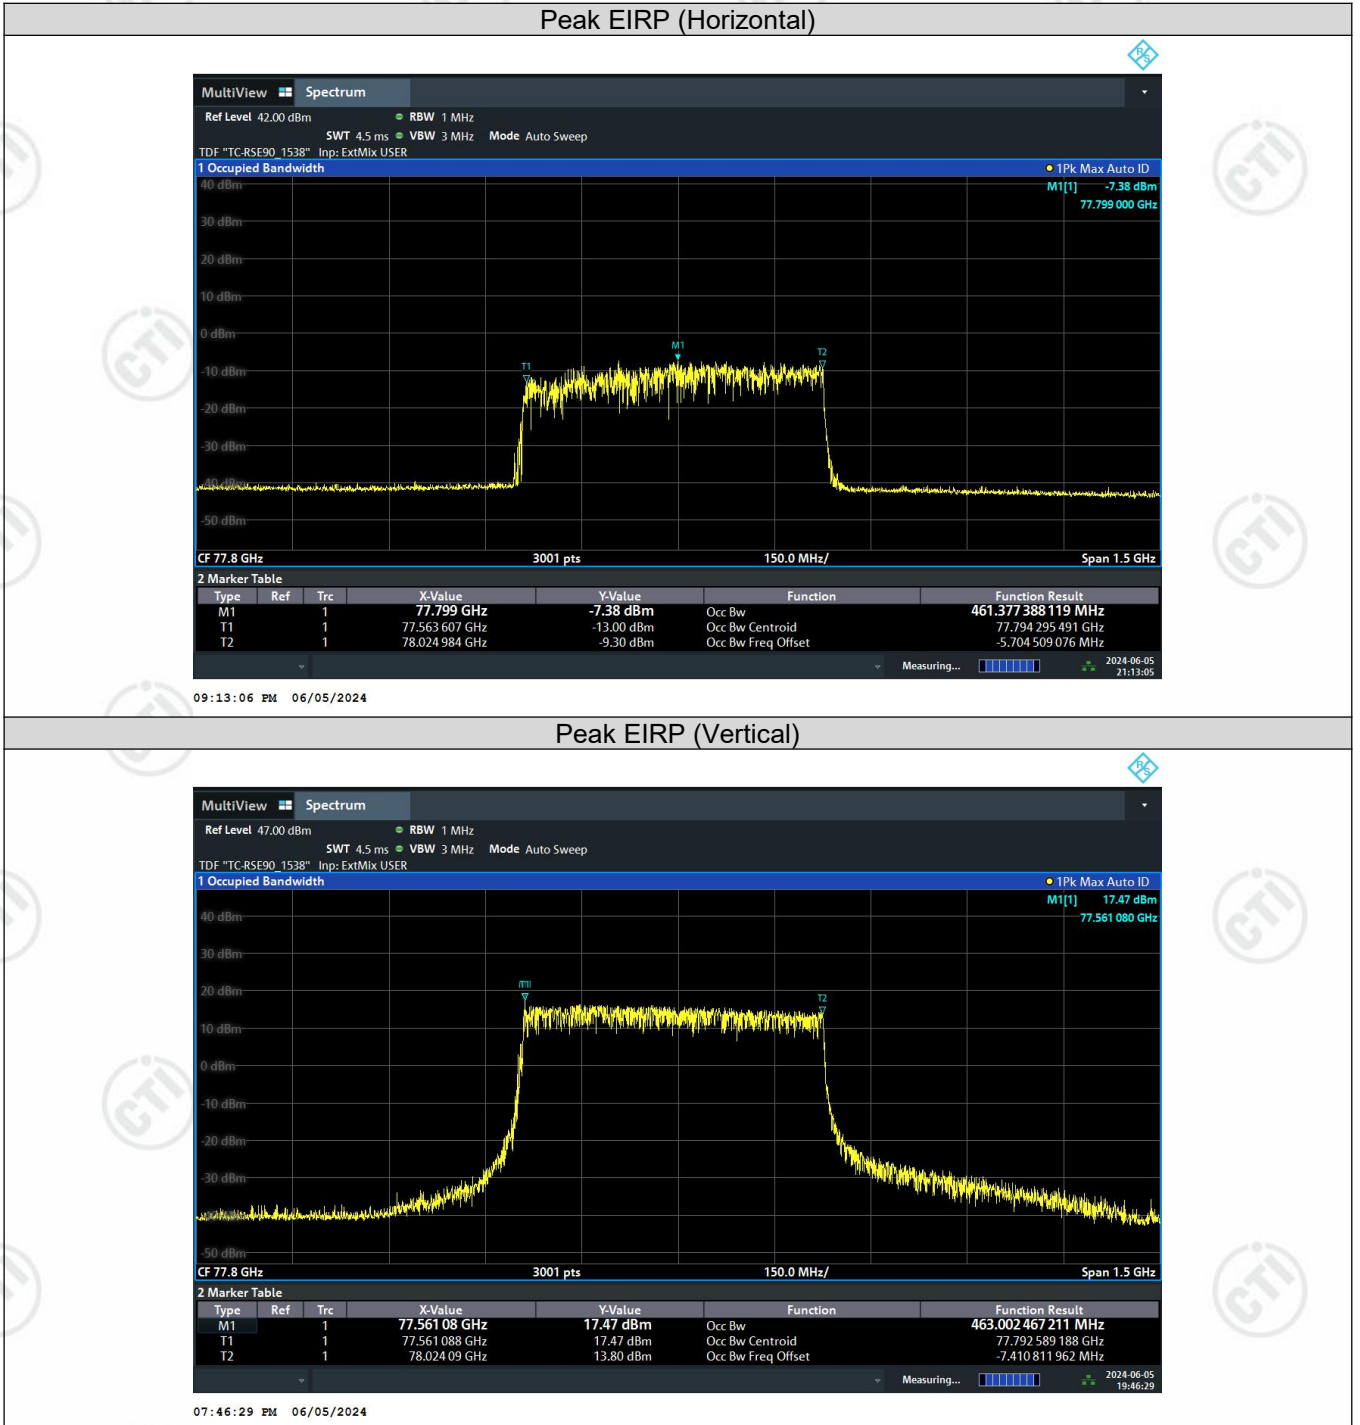

Sample calculation for FMCW chirps correction factor:

$$CF_{chirp} = 5 * \log_{10} (1 + 0.1947 * (468.75MHz / (40\mu s * 1MHz^2))^2) = 7.22dB$$

Note: Span=468.75MHz, t=40us, refer to the section of 5.1, claimed by the customer.

- ④ Guidance for calculating the correction factor is from Application Note 1EF107-1E Rohde & Schwarz Peak and Mean Power measurements on wideband FMCW radar signals.
- ⑤ Corrected EIRP(dBm/MHz)=EIRP(dBm/MHz)+FMCW Chirps Correction Factor(dB).
- ⑥ Only the worst case data was recorded in the report.

Above 41GHz:

**Test Procedure:**

Measuring the frequency range below 1GHz, the EUT is placed on a turn table which is 0.8 meter above ground, when measuring the frequency range above 1GHz, the EUT is placed on a turn table which is 1.5 meter above ground.

The turn table is rotated 360 degrees to determine the position of the maximum emission level.

The EUT was positioned such that the distance from antenna to the EUT was 3 meters.

The antenna is scanned between 1 meter and 4 meters to find out the maximum emission level. This is repeated for both horizontal and vertical polarization of the antenna. In order to find the maximum emission, all of the interface cables were manipulated according to ANSI C63.10: 2013 on radiated measurement.

The resolution bandwidth below 30MHz setting on the field strength meter is 9kHz and 30MHz~1GHz is 120kHz and above 1GHz is 1MHz.

Radiated emission measurements below 30MHz are made using Loop Antenna and 30MHz~1GHz are made using broadband Bilog antenna and above 1GHz are made using Horn Antennas.

The measurement is divided into the Preliminary Measurement and the Final Measurement.

The suspected frequencies are searched for in Preliminary Measurement with the measurement antenna kept pointed at the source of the emission both in azimuth and elevation, with the polarization of the antenna oriented for maximum response. The antenna is pointed at an angle towards the source of the emission, and the EUT is rotated in both height and polarization to maximize the measured emission. The emission is kept within the illumination area of the 3 dB bandwidth of the antenna.

|                   |                                                                                          |
|-------------------|------------------------------------------------------------------------------------------|
|                   | The measurement frequency range form 9kHz - 231GHz was investigated (preferably 243GHz). |
| <b>Test Mode:</b> | TX mode_Make EUT continuously emit radar signals.                                        |

## Radiated Spurious Emission below 30MHz:

9 kHz~30 MHz Field Strength of Unwanted Emissions. Quasi-Peak Measurement

The measurements with active loop antenna were greater than 20dB below the limit, so the test data were not recorded in the test report.

## Radiated Spurious Emission 30MHz-1GHz:

Test data:

Note:

① Measurement(dBuV/m)=Reading Level(dBuV)+Correct Factor(dB);

② Margin(dB)=Measurement(dBuV/m)-Limit(dBuV/m);

Note:

① Measurement(dBuV/m)=Reading Level(dBuV)+Correct Factor(dB);

② Margin(dB)=Measurement(dBuV/m)-Limit(dBuV/m);

## Radiated Spurious Emission 1GHz-18GHz:

### Test data:

| NO | Freq. [MHz] | Factor [dB] | Reading [dBμV] | Level [dBμV/m] | Limit [dBμV/m] | Margin [dB] | Result | Polarity   | Remark |

### Remark:

- The field strength is calculated by adding the Antenna Factor, Cable Factor & Pre-amplifier. The basic equation with a sample calculation is as follows:  
Final Test Level = Receiver Reading + Antenna Factor + Cable Factor – Pre-amplifier Factor
- For 40GHz to 41GHz, the limit is 600pW/cm<sup>2</sup> equivalent to an electric field strength of 93.57dBuV/m@3m. Only the worst case data was recorded in the report.

## Radiated Spurious Emission 41GHz-243GHz:

### Test data:

| Test Frequency (GHz) | Polarity   | EIRP/1MHz (dBm) | Power density(pW/cm <sup>2</sup> ) @3m distance | Limit of Power density(pW/cm <sup>2</sup> ) @3m distance | Result |

### Note:

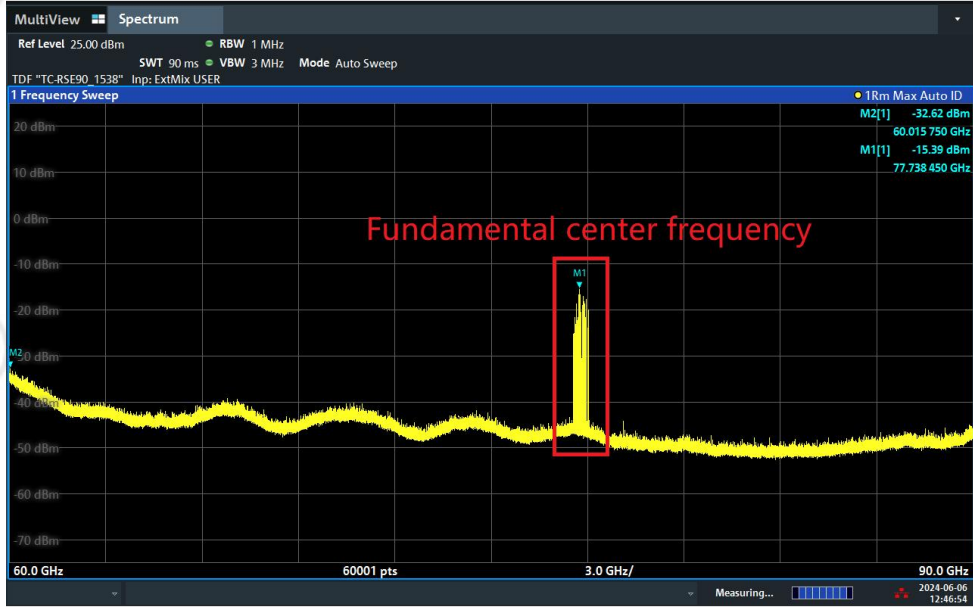

- ① EIRP(dBm/MHz) has added free space loss of 1.0m distance.
- ② Only the worst case data was recorded in the report.
- ③ Power density(pW/cm<sup>2</sup>)=10<sup>EIRP/1MHz(dBm)+10\*10<sup>9</sup>÷[4\*π\*(3m\*100)<sup>2</sup>]</sup>;

| <b>Test Procedure:</b>   | <p>The carrier frequency of the transmitter is measured at room temperature. (20°C to provide a reference)</p> <p>At 10°C intervals of temperatures between -30°C and +50°C at the manufacturer's rated supply voltage, and At +20°C temperature and ±15% supply voltage variations. If a product is specified to operate over a range of input voltage then the -15% variation is applied to the lowermost voltage and the +15% is applied to the uppermost voltage.</p> <p>Measurement data showing variation in transmitter output frequency from a cold start and the elapsed time necessary for the frequency to stabilize within the applicable tolerance.</p> <p>Tests shall be made after temperature stabilization at each of the ambient temperature levels; the lower temperature limit, 0°C and + 30°C with no primary power applied.</p> <p>Beginning at each temperature level , the frequency shall be measured within one minute after application of primary power to the transmitter and at intervals of no more than one minute thereafter until ten minutes have elapsed or until sufficient measurements are obtained to indicate clearly that the frequency has stabilized within the applicable tolerance, whichever time period is greater.</p> <p>During each test, the ambient temperature shall not be allowed to rise more than 10°C above the respective beginning ambient temperature level.</p> |
| <b>Test Mode:</b>        | TX mode_Make EUT continuously emit radar signals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Test data:**

| Voltage (%) | Power (V/DC) | Temperature (°C) | Frequency Left (GHz) | Frequency Right (GHz) | Limit (GHz) | Result |
