4. TEST CONDITIONS AND RESULTS

4.1. Antenna requirement

Requirement

FCC CFR Title 47 Part 15 Subpart C Section 15.203:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

Refer to statement below for compliance.

The manufacturer may design the unit so that the user can replace a broken antenna, but the use of a standard antenna jack or electrical connector is prohibited. Further, this requirement does not apply to intentional radiators that must be professionally installed.

Test Result:

The antenna is integral antenna, the best case gain of the antenna is 0dBi

4.2. AC Power Conducted Emission(Not Applicable)

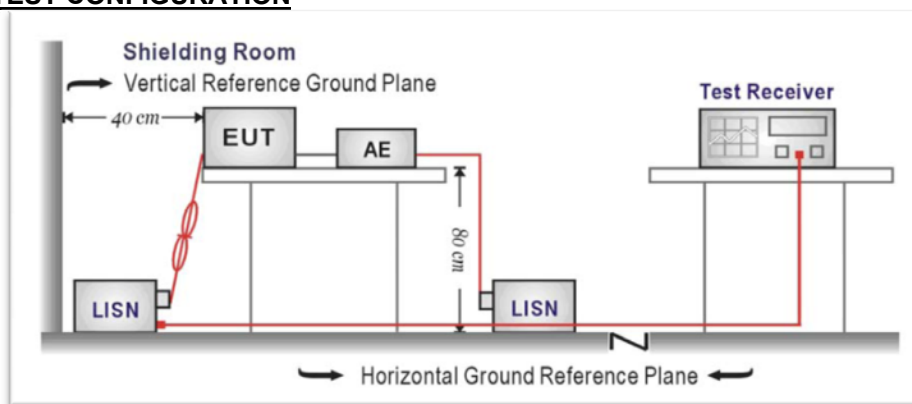

LIMIT

For intentional device, according to § 15.207(a) AC Power Conducted Emission Limits is as following :

TEST CONFIGURATION

TEST PROCEDURE

- 1 The equipment was set up as per the test configuration to simulate typical actual usage per the user's manual. The EUT is a tabletop system, a wooden table with a height of 0.8 meters is used and is placed on the ground plane as per ANSI C63.10-2009.
- 2 Support equipment, if needed, was placed as per ANSI C63.10-2009
- 3 All I/O cables were positioned to simulate typical actual usage as per ANSI C63.10-2009
- 4 The EUT received DC5V power from the adapter, the adapter received AC120V/60Hz power through a Line Impedance Stabilization Network (LISN) which supplied power source and was grounded to the ground plane.
- 5 All support equipments received AC power from a second LISN, if any.
- 6 The EUT test program was started. Emissions were measured on each current carrying line of the EUT using a spectrum Analyzer / Receiver connected to the LISN powering the EUT. The LISN has two monitoring points: Line 1 (Hot Side) and Line 2 (Neutral Side). Two scans were taken: one with Line 1 connected to Analyzer / Receiver and Line 2 connected to a 50 ohm load; the second scan had Line 1 connected to a 50 ohm load and Line 2 connected to the Analyzer / Receiver.
- 7 Analyzer / Receiver scanned from 150 KHz to 30MHz for emissions in each of the test modes.
- 8 During the above scans, the emissions were maximized by cable manipulation.

TEST RESULTS

Not applicable to this device.

TEST CONFIGURATION

Radiated Emission Test Set-Up

Frequency range 9KHz – 30MHz

Frequency range 30MHz – 1000MHz

Frequency range above 1GHz-25GHz

TEST PROCEDURE

- 1 The EUT was placed on a turn table which is 0.8m above ground plane.
- 2 Maximum procedure was performed by raising the receiving antenna from 1m to 4m and rotating the turn table from 0° to 360° to acquire the highest emissions from EUT
3. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
4. Repeat above procedures until all frequency measurements have been completed.
5. the fundamental frequency is 315.0MHz, So the radiation emissions frequency range were tested from 30MHz to 4GHz.

TEST RESULTS

The emissions from 9kHz to 4GHz are measured peak and average level, below 1GHz measured QP level, detailed test data please see below. Besides, we tested 3 direction and recorded the worst data from 30MHz to 4GHz.

The frequency spectrum above 1 GHz for Transmitter was investigated. All emission not reported are much lower than the prescribed limits. Set the RBW=1MHz, VBW=3MHz for Peak Detector while the Average Result calculated from PEAK, the Average Result = Peak Field Strength + Duty Cycle Correction Factor.

Note 1:

- Below 30MHz, found the radiated emission level is very low, so don't show on the report.
- According to section 15.35(b), when average radiated emission measurements are specified, including emission measurement below 1000MHz, there also is limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20dB above the maximum permitted average limit for the frequency being investigated.

Note 2: Average Result =Peak Field Strength+Duty Cycle Correction Factor.

Note 3: Duty Cycle Correction Factor value refers to below.

Note4: PDCF calculation, according above RBW=1MHz=1X10⁶Hz,

$$BW= 2/PW \text{ (pulse width)}=2/ [(1.62-1.18) \text{ ms} \times (12+29)+(3.39-2.50) \text{ ms} \times 35]=2/49.19 \times 10^{-3}=41 \text{ Hz}$$

SoRBW> 2/PW PDCF is not necessary.

Duty Cycle Correction Factor

$$\text{Duty Cycle} = \text{TX on}/(\text{TX on} + \text{TX off}) \times 100\% = [(1.62-1.18) \text{ ms} \times (12+29)+(3.39-2.50) \text{ ms} \times 35]/118.0 \text{ ms} \times 100\% = 41.67\%$$

TX on= TX on(narrower pulses)+ TX on(winder pulses)=Time of one narrower pulse X Number of narrower pulses + Time of one winder pulse X Number of winder pulses = (Marker 2-Marker1)X Number of narrower pulses+ (Marker 4-Marker1)X Number of winder pulses

$$\text{Duty Cycle Correction Factor} = 20 \log (\text{Duty Cycle}) = -7.60$$
