## GENERAL REPORT SUMMARY

This electromagnetic emission test report is generated by Compatible Electronics Inc., which is an independent testing and consulting firm. The test report is based on testing performed by Compatible Electronics personnel according to the measurement procedures described in the test specifications given below and in the "Test Procedures" section of this report.

The measurement data and conclusions appearing herein relate only to the sample tested and this report may not be reproduced without the written permission of Compatible Electronics, unless done so in full.

This report must not be used by the client to claim product certification, approval or endorsement by NVLAP, NIST or any agency of the U.S. government.

Device Tested: 3-Gang Switch Plate
Model: LS03
S/N: N/A
Product Description: The equipment under test is a wall mountable, battery powered, wireless 3-Gang Switch Plate.
Panel Backplate Dimensions: $1.5 \mathrm{~cm}(\mathrm{~L}) \times 12.2 \mathrm{~cm}(\mathrm{~W}) \times 11 \mathrm{~cm}(\mathrm{H})$
Toggle Backplate Dimensions: $2.4 \mathrm{~cm}(\mathrm{~L}) \times 16.7 \mathrm{~cm}(\mathrm{~W}) \times 11 \mathrm{~cm}(\mathrm{H})$
Clock(s): $38 \mathrm{MHz}, 2405 \mathrm{MHz}, 2440 \mathrm{MHz}$ and 2480 MHz
Modifications: The EUT was not modified in order to meet the specifications.
Customer: Vivint, Inc.
4931 N. 300 W.
Provo, Utah 84604 USA
Test Dates: June 6, 7, 8 and 15, 2022
Test Specification covered by accreditation:

Test Specifications: Emissions requirements
CFR Title 47, Part 15, Subpart B; and Subpart C, sections 15.205, 15.207, 15.209, and 15.247; RSS-247 and RSS-GEN

Test Procedures:
ANSI C63.4 and ANSI C63.10
Test Deviations: The test procedure was not deviated from during the testing.

## SUMMARY OF TEST RESULTS

| TEST | DESCRIPTION | RESULTS |
| :---: | :---: | :---: |
| 1 | Conducted RF Emissions, 150 kHz 30 MHz | This test was not performed because the EUT operates on internal battery power only and cannot be connected to the AC public mains. |
| 2 | Radiated RF Emissions, $9 \mathrm{kHz}-25000 \mathrm{MHz}$ | Complies with the Class B limits of CFR Title 47, Part 15, Subpart B; and the limits of CFR Title 47, Part 15 Subpart C, 15.205, 15.209 and 15.247 (d); RSS-247 and RSS-GEN <br> Highest reading in relation to spec limit $32.20 \mathrm{~dB} \mu \mathrm{~V} / \mathrm{m}(\mathrm{QP}) @ 633.50 \mathrm{MHz}(* \mathrm{U}=3.30 \mathrm{~dB})$ |
| 3 | DTS Bandwidth | Complies with the relevant requirements of CFR Title 47, Part 15, Subpart C, section 15.247 (a)(2); RSS-247 |
| 4 | Peak Output Power | Complies with the relevant requirements of FCC Title 47, Part 15, Subpart C, section 15.247 (b)(3); RSS-247 |
| 5 | RF Band Edges | Complies with the relevant requirements of FCC Title 47, Part 15, Subpart C, section 15.247 (d); RSS-247 |
| 6 | Spectral Density | Complies with the relevant requirements of FCC Title 47, Part 15, Subpart C, section 15.247 (e); RSS-247 |

## 1. PURPOSE

This document is a qualification test report based on the emissions tests performed on the 3-Gang Switch Plate, Model: LS03 (EUT). The emissions measurements were performed according to the measurement procedure described in ANSI C 63.4 and ANSI C 63.10. The tests were performed in order to determine whether the electromagnetic emissions from the equipment under test, referred to as EUT hereafter, are within the Class B specification limits defined by CFR Title 47, Part 15, Subpart B; and Subpart C, sections 15.205, 15.207, 15.209, and 15.247; RSS-247 and RSS-Gen.

## 1.1 DECISION RULE \& RISK

If a measured value exceeds a specification limit it implies non-compliance. If the value is below a specification limit it implies compliance. Measurement uncertainty of the laboratory is reported with all measurement results but generally not taken into consideration unless a standard, rule or law requires it to be considered.

Qualification test reports are only produced for products that are in compliance with the test requirements, therefore results are always in conformity. Otherwise, an engineering report or just the data is provided to the customer.

When performing a measurement and making a statement of conformity, in or out-of-specification to manufacturer's specifications or Pass/Fail against a requirement, there are two possible outcomes:

- The result is reported as conforming with the specification
- The result is reported as not conforming with the specification

The decision rule is defined below.
When the test result is found to be below the limit but within our measurement uncertainty of the limit, it is our policy that the final acceptance decision is left to the customer, after discussing the implications and potential risks of the decision.

When the test result is found to be exactly on the specification, it is our policy, in the case of unwanted emissions measurements to consider the result non-compliant; however, the final decision is left to the customer, after discussing the implications and potential risks of the decision.

When the test result is found to be over the specification limit under any condition, it is our policy to consider the result non-compliant.

In terms of uncertainty of measurement, the laboratory is a calibrated and tightly controlled environment and generally exceptionally stable, the measurement uncertainties are evaluated without the consideration of the test sample. When it comes to the test sample however, as most testing is performed on a single sample rather than a sample population, and that sample is often a preproduction representation of the final product that test sample represents a significantly higher source of measurement uncertainty. We advise our customers of this and that when in doubt (small test to limit margins), they may wish to perform statistical sampling on a population to gain a higher confidence in the results. All lab reported results are that of a single sample in any event.

## 2. ADMINISTRATIVE DATA

### 2.1 Location of Testing

The emissions tests described herein were performed at the test facility of Compatible Electronics, 114 Olinda Drive, Brea, California 92823.

### 2.2 Traceability Statement

The calibration certificates of all test equipment used during the test are on file at the location of the test. The calibration is traceable to the National Institute of Standards and Technology (NIST).

### 2.3 Cognizant Personnel

Vivint, Inc.
Greg Hansen Regulatory Compliance Manager
Compatible Electronics Inc.
$\begin{array}{lr}\text { Kyle Fujimoto } & \text { Sr. Test Engineer } \\ \text { James Ross } & \text { Sr. Test Engineer }\end{array}$

### 2.4 Date Test Sample was Received

The test sample was received prior to initial date of testing. Received as defined in product description.

## $2.5 \quad$ Disposition of the Test Sample

The test sample has not been returned to Vivint, Inc. as of the date of this test report.

### 2.6 Abbreviations and Acronyms

The following abbreviations and acronyms may be used in this document.

| EMI | Electromagnetic Interference |
| :--- | :--- |
| EUT | Equipment Under Test |
| P/N | Part Number |
| S/N | Serial Number |
| ITE | Information Technology Equipment |

## 4. DESCRIPTION OF TEST CONFIGURATION

The 3-Gang Switch Plate, Model: LS03 (EUT) was tested as a stand-alone device. The EUT was continuously transmitting at the low, middle, or high channel.

The EUT was tested for emissions while in the Y and Z axis. The Y orientation is when the EUT is perpendicular to the ground mounted vertically. The Z orientation is when the EUT is perpendicular to the ground mounted horizontally.

The Z axis was the worst case.
The firmware inside the EUT allowed the EUT to continuously transmit at the low, middle, or high channel by hitting the reset switch inside the EUT.

The firmware is stored on the company's servers.
The radiated data was taken in the continuously exercising mode of operation. All initial investigations were performed with the EMI Receiver in manual mode scanning the frequency range continuously. The cables were bundled and routed as shown in the photographs in Appendix D.

### 4.1.1 Cable Construction and Termination

There were no external cables connected to the EUT.

## LISTS OF EUT, ACCESSORIES AND TEST EQUIPMENT

## 6. TEST SITE DESCRIPTION

### 6.1 Test Facility Description

Please refer to section 2.1 and 7.1 of this report for emissions test location.

### 6.2 EUT Mounting, Bonding and Grounding

For frequencies $\mathbf{1} \mathbf{~ G H z}$ and below: The EUT was mounted on a 0.6 by 1.2 meter non-conductive table 0.8 meters above the ground plane.

For frequencies above $\mathbf{1 ~ G H z}$ : The EUT was mounted on a 0.6 by 1.2 meter non-conductive table 1.5 meters above the ground plane.

The EUT was not grounded.

### 6.3 Measurement Uncertainty

"Compatible Electronics" $\mathrm{U}_{\text {lab }}$ value is less than $\mathrm{U}_{\text {cispr }}$, thus based on this - compliance is deemed to occur if no measured disturbance exceeds the disturbance limit.

The uncertainty represents an expanded uncertainty expressed at approximately the $95 \%$ confidence level, using a coverage factor of $\mathrm{k}=2$
$u_{c}(y)=\sqrt{\sum_{i} c_{i}^{2} u^{2}\left(x_{i}\right)}$

| Measurement |  | U $_{\text {cispr }}$ | Ulab $=\mathbf{2 u c}(\mathbf{y})$ |
| :--- | :---: | :---: | :---: |
| Conducted disturbance <br> (mains port) | $(150 \mathrm{kHz}-30 \mathrm{MHz})$ | 3.4 dB | 2.72 dB |
| Radiated disturbance <br> (electric field strength on an open <br> area test site or alternative test site) | $(30 \mathrm{MHz}-1,000 \mathrm{MHz})$ | 6.3 dB | 3.32 dB (Vertical) <br> 3.30 dB (Horizontal) |
| Radiated disturbance <br> (electric field strength on an open <br> area test site or alternative test site) | $(1 \mathrm{GHz}-6 \mathrm{GHz})$ | 5.2 dB | 4.06 dB |
| Radiated disturbance <br> (electric field strength on an open <br> area test site or alternative test site) | $(6 \mathrm{GHz}-18 \mathrm{GHz})$ | 5.5 dB | 4.06 dB |
| Radiated disturbance <br> (electric field strength on an open <br> area test site or alternative test site) | $(18 \mathrm{GHz}-26 \mathrm{GHz})$ | $\mathrm{N} / \mathrm{A}$ | 4.43 dB |
| Radiated disturbance <br> (electric field strength on an open <br> area test site or alternative test site) | $(26.5 \mathrm{GHz}-40 \mathrm{GHz})$ | $\mathrm{N} / \mathrm{A}$ | 4.57 dB |

## 7. CHARACTERISTICS OF THE TRANSMITTER

The following sections describe the test methods and the specifications for the tests. Test results are also included in this section.

### 7.1 Channel Number and Frequencies

The EUT uses a total of 16 channels.
The low channel is 2405 MHz
The middle channel is 2440 MHz
The high channel is 2480 MHz

### 7.2 Antenna

The EUT has a 5.4 dBi gain PCB trace antenna.

## TEST PROCEDURES

The following sections describe the test methods and the specifications for the tests. Test results are also included in this section.

### 8.1 RF Emissions

### 8.1.1 Conducted Emissions Test

The EMI Receiver was used as a measuring meter. A quasi-peak and/or average reading was taken only where indicated in the data sheets. A 10 dB attenuator used for the protection of the EMI Receiver input stage, and the offset was adjusted accordingly to read the actual data measured. The LISN output was measured using the EMI Receiver. The output of the second LISN was terminated by a 50 -ohm termination. The effective measurement bandwidth used for this test was 9 kHz .
Please see section 6.2 of this report for mounting, bonding, and grounding of the EUT. The EUT was powered through the LISN, which was bonded to the ground plane. The LISN power was filtered and the filter was bonded to the ground plane. The EUT was set up with the minimum distances from any conductive surfaces as specified in ANSI 63:4. The excess power cord was wrapped in a figure eight pattern to form a bundle not exceeding 0.4 meters in length.
The conducted emissions from the EUT were maximized for operating mode as well as cable placement. The final data was collected under program control by computer software. The final qualification data is located in Appendix E.

## Test Results:

This test was not performed because the EUT operates on battery power only and cannot be connected to the AC public mains.
Brea Division
114 Olinda Drive
Brea, CA 92823
(714) 579-0500
(714) 579-0500

### 8.1.2 Radiated Emissions Test

The EMI Receiver was used as the measuring meter. Above 1000 MHz , preamplifiers were used to increase the sensitivity of the instrument. The EMI Receiver was initially used with the Analyzer mode feature activated. In this mode, the EMI receiver can then record the actual frequency to be measured. This final reading is then taken accurately in the EMI Receiver mode, which takes into account the cable loss, amplifier gain and antenna factors, so that a true reading is compared to the true limit. The effective measurement bandwidth used for the radiated emissions test was according to the frequency measured.

The frequencies below 1 GHz were quasi-peaked using the quasi-peak detector of the EMI Receiver.
The frequencies above 1 GHz were averaged using the duty cycle correction factor in section 8.8 of this test report.

The EMI test chamber of Compatible Electronics, Inc. was used for radiated emissions testing. This test site is in full compliance with ANSI C63.4 and ANSI C63.10. Please see section 6.2 of this report for mounting, bonding and grounding of the EUT. The turntable supporting the EUT is remote controlled using a motor. The turntable permits EUT rotation of 360 degrees in order to maximize emissions. Also, the antenna mast allows height variation of the antenna from 1 meter to 4 meters. Data was collected in the worst case (highest emission) configuration of the EUT. At each reading, the EUT was rotated 360 degrees and the antenna height was varied from 1 to 4 meters (for E field radiated field strength). The gunsight method was used when measuring with the horn antenna in order to ensure accurate results.

The EUT was tested at a 3-meter test distance. The six highest emissions are listed in Table 1.
The measurement bandwidths and transducers used for the radiated emissions test were:

| FREQUENCY RANGE | EFFECTIVE <br> MEASUREMENT <br> BANDWIDTH | TRANSDUCER |
| :---: | :---: | :---: |
| 9 kHz to 150 kHz | 200 Hz | Loop Antenna |
| 150 kHz to 30 MHz | 9 kHz | Loop Antenna |
| 30 MHz to 1 GHz | 120 kHz | CombiLog Antenna |
| 1 GHz to 25 GHz | 1 MHz | Horn Antenna |

## Test Results:

The EUT complies with the Class B limits of CFR Title 47, Part 15, Subpart B; the limits of CFR Title 47, Part 15, Subpart C sections 15.205, 15.209 and 15.247; and the limits of RSS-247 and RSS-Gen for radiated emissions.

Newbury Park Division 1050 Lawrence Drive Newbury Park, CA 91320
(805) 480-4044

### 8.1.3 RF Emissions Test Results

Table 1 RADIATED EMISSION RESULTS
3-Gang Switch Plate
Model: LS03

| Frequency <br> (MHz) | EMI Reading (dBuV/m) | Specification Limit (dBuV/m) | Delta (Cor. Reading - Spec. Limit) (dB) |
| :---: | :---: | :---: | :---: |
| 633.50 (H) (High - Z-Axis) | 32.20 (QP) | 46.00 | -13.80 |
| 2483.50 (H) (BE - Z-Axis) | 39.86 (AV) | 53.97 | -14.11 |
| 389.70 (H) (High - Z-Axis) | 28.74 (QP) | 46.00 | -17.26 |
| 161.90 (H) (High - Z-Axis) | 26.07 (QP) | 43.50 | -17.43 |
| 2483.50 (V) (BE - Y-Axis) | 36.15 (AV) | 53.97 | -17.82 |
| 377.50 (H) (High - Z-Axis) | 27.78 (QP) | 46.00 | -18.22 |

Notes: * The complete emissions data is given in Appendix E of this report.
(V) Vertical
(H) Horizontal

Low Low Channel
Mid Middle Channel
High High Channel
BE Band Edge
AV Average
QP Quasi-Peak

## Sample Calculations

A correction factor for the antenna, cable and a distance factor (if any) must be applied to the meter reading before a true field strength reading can be obtained. This Corrected Meter Reading is then compared to the specification limit in order to determine compliance with the limits.

Conversion to logarithmic terms: Specification limit $(\mu \mathrm{V} / \mathrm{m}) \log \mathrm{x} 20=$ Specification Limit in $\mathrm{dBuV} / \mathrm{m}$

To correct for distance when measuring at a distance other than the specification
For measurements below 30 MHz : (Specification distance / test distance) $\log \mathrm{x} 40=$ distance factor For measurements above 30 MHz : (Specification distance / test distance) $\log \mathrm{x} 20=$ distance factor

Note: When using an Active Antenna, the Antenna factor shall be subtracted due to the combination of the internal amplification and antenna loss.

Corrected Meter Reading $=$ meter reading $+\mathrm{F}-\mathrm{A}+\mathrm{C}$
where: $\quad \mathrm{F}=$ antenna factor
A= amplifier gain
C = cable loss
The correction factors for the antenna and the amplifier gain are attached in Appendix D of this report. The data sheets are attached in Appendix E.

The distance factor D is 0 when the test is performed at the required specification distance.

## 8.2 <br> DTS Bandwidth

The DTS Bandwidth was measured using the EMI Receiver. The following steps were performed for measuring the DTS Bandwidth.

1. Set $\mathrm{RBW}=100 \mathrm{kHz}$
2. Set the video bandwidth (VBW) to equal or greater than 3 times the RBW
3. Detector $=$ Peak
4. Trace Mode = Max Hold
5. Sweep $=$ Auto Couple
6. Allow the trace to stabilize
7. Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

## Test Results:

The EUT complies with the relevant requirements of FCC Title 47, Part 15, Subpart C section 15.247 (a)(2); and RSS-247.

### 8.3 Maximum Peak Conducted Output Power

The Maximum Peak Conducted Output Power was measured using the EMI Receiver. The Maximum Peak Conducted Output Power was measured using the procedure described in section 11.9.1.1 of ANSI C63.10. The Maximum Peak Conducted Output Power was then taken. The following steps were performed for measuring the Maximum Peak Conducted Output Power.

1. Set the RBW $\geq$ DTS bandwidth
2. Set VBW $\geq[3 \times R B W]$
3. Set span $\geq[3 \times R B W]$
4. Sweep time $=$ auto couple
5. Detector $=$ peak
6. Trace mode $=$ max hold
7. Allow trace to fully stabilize
8. Use peak marker function to determine the peak amplitude level

## Test Results:

The EUT complies with the relevant requirements of FCC Title 47, Part 15, Subpart C section 15.247 (b)(3); and RSS-247.

### 8.4 Emissions in Non-restricted Frequency Bands

The emissions in the non-restricted frequency bands measurements were performed using the EMI receiver directly connected to the EUT. The reference level was established by setting the instrument center frequency to the DTS channel center frequency. The span was set to $\geq 1.5$ times the DTS bandwidth. The RBW was set to 100 kHz and the VBW was set to 300 kHz . A peak detector was used with sweep set to auto. A max hold trace was used and allowed to fully stabilize. The peak marker function was used to determine the reference level. For emission level measurement, the center frequency and span were set to encompass the frequency range to be measured. The RBW was set to 100 kHz and the VBW was set to 300 kHz . A peak detector was used with a sweep time set to auto. The number of measurement points were greater than the span/RBW. A max hold trace was used and allowed to fully stabilize. The peak marker function was used to determine the maximum amplitude level. The final qualification data sheets are located in Appendix E.

## Test Results:

The EUT complies with the relevant requirements of FCC Title 47, Part 15, Subpart C section 15.247 (d); and RSS-247.

### 8.5 RF Band Edges

The RF band edges were taken at 2390 MHz when the EUT was on the low channel and 2483.5 MHz when the EUT was on the high channel using the EMI Receiver. A preamplifier was used to boost the signal level, with the plots being taken at a 3 meter test distance. The radiated emissions test procedure as describe in section 8.1.2 of this test report was used to maximize the emission.

## Test Results:

The EUT complies with the relevant requirements of FCC Title 47, Part 15, Subpart C section 15.247 (d); and RSS-247. The RF power at the restricted bands closest to the band edges at 2390 MHz and 2483.5 MHz also meet the limits of section 15.209. Please see the data sheets located in Appendix E.

### 8.6 Spectral Density Test

The spectrum density output was measured using the EMI Receiver. The spectral density output was measured using a direct connection from the RF out on the EUT into the input of the EMI Receiver. The following steps were performed for measuring the spectral density.

1. Set analyzer center frequency to DTS channel center frequency
2. Set the span to 1.5 times the OBW.
3. Set the RBW to $3 \mathrm{kHz} \leq \mathrm{RBW} \leq 100 \mathrm{kHz}$
4. Set the VBW $\geq[3 \mathrm{X} \mathrm{RBW}]$
5. Detector = peak
6. Sweep time = auto couple
7. Trace mode $=$ max hold
8. Allow the trace to fully stabilize.
9. Use the peak marker function to determine the maximum amplitude level within the RBW
10. If measured value exceeds limit, reduce RBW (no less than 3 kHz ) and repeat.

## Test Results:

The EUT complies with the relevant requirements of FCC Title 47, Part 15, Subpart C section 15.247 (e); and RSS-247.

## $8.7 \quad 99$ \% Bandwidth

The 99 \% bandwidth was measured using an EMI Receiver.
The following steps were performed for measuring the $99 \%$ bandwidth per RSS-GEN, Issue 5, clause 6.7:

1. Set RBW to $1 \%$ to $5 \%$ of the actual occupied bandwidth.
2. Set VBW to greater than 3 times the RBW.
3. Set the EMI Receiver to the occupied bandwidth Function set at $99 \%$
4. Set the peak detector to max hold.
5. Set the sweep time to auto
6. Allow the trace to stabilize.

Please note that this was only used to determine the emission bandwidth and that there are no limits or pass/fail criteria for this test. Please see the data sheets located in Appendix E.

[^0]
### 8.8 Duty Cycle Calculation

The fundamental and harmonics were measured at a 3-meter test distance. The EMI Receiver was used to obtain the final test data. The final qualification data sheets are located in Appendix E.

Where
$\delta(\mathrm{dB})=20 \log \left[\sum\left(n t_{1}+m t_{2}+\ldots+\xi t_{x}\right) / T\right]$
$n$ is the number of pulses of duration $t 1$
$m$ is the number of pulses of duration $t 2$
$\xi$ is the number of pulses of duration $t x$
$T$ is the period of the pulse train or 100 ms if the pulse train length is greater than 100 ms
The worst case was when the EUT was in data mode
Duty Cycle Correction Factor $=-20 \mathrm{~dB}$
Time of One Pulse $=700 \mu \mathrm{~s}$
Total On Time $=700 \mu \mathrm{~s}$
The time between pulses is 2990 ms
Duty Cycle $=700 \mu \mathrm{~s} / 100 \mathrm{~ms}=0.007=0.7 \%$
The maximum Peak to Average ratio of -20 dB can be utilized

NOTE: The band edge data utilizes an RMS average

## 9.

## CONCLUSIONS

The 3-Gang Switch Plate, Model: LS03 (EUT), as tested, meets all of the specification limits defined in CFR Title 47, Part 15, Subpart B; and Subpart C, sections 15.205, 15.207, 15.209, and 15.247; RSS-GEN and RSS-247.

# LABORATORY ACCREDITATIONS AND RECOGNITIONS 

For US, Canada, Australia/New Zealand, Japan, Taiwan, Korea, and the European Union, Compatible Electronics is currently accredited by NVLAP to ISO/IEC 17025.

For the most up-to-date version of our scopes and certificates please visit
http://celectronics.com/quality/scope/

Quote from ISO-ILAC-IAF Communiqué on the Management Systems Requirements of ISO/IEC 17025, General Requirements for the competence of testing and calibration laboratories:
"A laboratory's fulfilment of the requirements of ISO/IEC 17025 means the laboratory meets both the technical competence requirements and management system requirements that are necessary for it to consistently deliver technically valid test results and calibrations. The management system requirements in ISO/IEC 17025 are written in language relevant to laboratory operations and operate generally in accordance with the principles of ISO 9001"

## MODIFICATIONS TO THE EUT

The modifications listed below were made to the EUT to pass FCC Subpart B and FCC 15.247; RSS-GEN and RSS-247 specifications.

All the rework described below was implemented during the test in a method that could be reproduced in all the units by the manufacturer.

No modifications were made to the EUT during the testing.

Lake Forest, CA 92630
(949) 587-0400

RF Antenna Conducted Test - High Channel - 30 MHz to 1 GHz

RF Antenna Conducted Test - High Channel - 1 GHz to 2.4 GHz

RF Antenna Conducted Test - High Channel - 2484 MHz to 10 GHz

RF Antenna Conducted Test - High Channel - 10 GHz to 25 GHz

## 3-GANG SWITCH PLATE

## MODEL: LS03

## EMISSIONS IN NON-RESTRICTED BANDS

| FREQUENCY <br> $(\mathbf{M H z})$ | LEVEL <br> $(\mathbf{d B m})$ | Limit* <br> $(\mathbf{d B m})$ | Margin <br> $(\mathbf{d B})$ |
| :---: | :---: | :---: | :---: |
| 24790.00 | -37.700 | -18.00 | -19.700 |
| 24040.00 | -40.789 | -17.67 | -23.119 |
| 6843.00 | -47.720 | -17.80 | -28.920 |

Note: The three highest non-restricted emissions are reported.
*The Limit is based on 20 dB below the highest reference level obtained on the previous pages.

## DUTY CYCLE

DATA SHEETS
