RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances \leq 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min.test separation distance, mm)] $\cdot [\sqrt{f(GHz)}] \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where

• f(GHz) is the RF channel transmit frequency in GHz

• Power and distance are rounded to the nearest mW and mm before calculation

• The result is rounded to one decimal place for comparison

Worse case is as below: [2480 MHz 5.72

dBm (3.73 mW) output power]

 $(3.73 \text{ mW} / 5 \text{mm}) \cdot [\sqrt{2.480} (\text{GHz})] = 1.2 < 3.0 \text{ for 1-g SAR}$ Then SAR evaluation is not required
