Anywave Communication Technologies Inc.

EMC TEST REPORT FOR

LPTV Digital ATSC Transmitter
Model: TRN-VI-500-C
(See Equipment Under Test for details)

Tested to The Following Standards:
FCC Part 74 Subpart G

Report No.: 102474-12

Date of issue: June 17, 2019

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

Test Certificate # 803.01

This report contains a total of 35 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc.

Test Report Information

REPORT PREPARED FOR:

Anywave Communication Technologies Inc.
300 Knightsbridge Parkway, Suite 150
Lincolnshire IL, 60069

Representative:
Erin Littell - F-Squared Labs
Ted Karam - Anywave Communication Technologies, Inc.
Customer Reference Number: 4530

REPORT PREPARED BY:

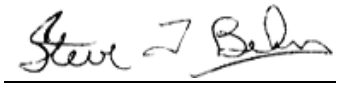
Terri Rayle
CKC Laboratories, Inc.
5046 Sierra Pines Drive
Mariposa, CA 95338

Project Number: 102474

DATE OF EQUIPMENT RECEIPT: May 23, 2019
DATE(S) OF TESTING: May 23-28, 2019

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the equipment provided by the client, tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.
.



Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

SUMMARY OF RESULTS

Standard / Specification: FCC Part 74 Subpart G

Test Procedure	Description	Modifications	Results
74.735(b)(1)	Power Limitations	NA	Pass
74.794(a)(2)(ii)	Occupied Bandwidth / Stringent Mask	NA	Pass
74.794(b)(1)	Radio Navigation Satellite Service Bands (GPS)	NA	NA1
74.794(a)(2)(ii)	Spurious Emissions at Antenna Terminal	NA	Pass
74.794(a)(2)(ii)	Field Strength of Spurious Radiation	NA	Pass
74.761(a)/74.761(b)	Frequency Tolerance – Voltage	NA	Pass
74.761(a)/74.761(b)	Frequency Tolerance - Temperature	NA	Pass

NA = Not Applicable

NA1 = Not applicable because the EUT does not operate on TV channels 22-24 (518-536 MHz), 32-36 (578-608 MHz), 38 (614-620 MHz), or 65-69 (776-806 MHz)

ISO/IEC 17025 Decision Rule
The declaration of pass or fail herein is based upon assessment to the specification(s) listed above, including where applicable, assessment of measurement uncertainties. For performance related tests, equipment was monitored for specified criteria identified in that section of testing.

Modifications During Testing

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions
No modifications were made during testing.

Modifications listed above must be incorporated into all production units.

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions
None

EQUIPMENT UNDER TEST (EUT)

During testing, numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

The 500W V1 ATSC Transmitter System, Model: TRN-VI-500-C consists of the following components under test.

Configuration 1

Equipment Tested:

Device	Manufacturer	Model #	S/N
5X+ Exciter	Anywave Communication Technologies Inc.	EXC-5X+C	1812144015970
Controller Module	Anywave Communication Technologies Inc.	CTL-V-C	1811100030202
500W VHF Band I PA - ATSC	Anywave Communication Technologies Inc.	AMP-VI-16-M-C	1809100010101
700W 6-pole VHF Band I CH5 (76-82MHz) BPF	COM-TECH	A-HR6PP110A-A005	1846-212030

Support Equipment:

Device	Manufacturer	Model #	S/N
None			

General Product Information:

Product Information	Manufacturer-Provided Details
Equipment Type:	Stand-Alone Equipment
Modulation Type(s):	8VSB (ATSC)
Maximum Duty Cycle:	100%
Antenna Type(s) and Gain:	NA. Device is not sold with antenna.
Antenna Connection Type:	External Connector 7/16 DIN
Nominal Input Voltage:	Exciter and Controller, 120Vac 60Hz Power Amplifier, 240Vac 60Hz
Firmware / Software used for Test:	Controller code revision: MCU: V2.4-181110 Exciter code revisions: MCU: V5.2AW_180608, FPGA:V2.2A_I_161107

General Test Setup

Test Conditions / Notes
The equipment under test (EUT) consists of an exciter, controller, power amplifier and band-pass filter. The connections are as follows: Power amplifier and controller LAN port to Ethernet switch via cat 5E UTP. Exciter Remote2 port to Ethernet switch via cat 5E UTP. RS-232 to RS-485 adapter to RS-485 cable connected from exciter REMOTE 1 to controller ERS485 A. RS-485 cable connected from controller PRS4851 to power amplifier RS485. Exciter RF OUT to controller RF IN A via coaxial cable. Exciter Feedback RF IN A to BPF Output directional coupler fwd port via coaxial cable. Exciter Feedback RF IN B to BPF Input directional coupler fwd port via coaxial cable. Controller RF OUT 2 to power amplifier RF IN via coaxial cable. Controller REFL IN port to power amplifier output directional coupler refl port via coaxial cable. Controller FWD IN port to power amplifier output directional coupler fwd port via coaxial cable. Power amplifier directional coupler output to directional coupler at input of BPF via coaxial cable. BPF directional coupler output to high power attenuator via coaxial cable. The exciter is setup on channel 5 (79MHz).

Customer:	**Anywave Communication Technologies Inc.**		
Specification:	**FCC 74.794(a)(2)(ii)**		
Work Order #:	**102474**	Date:	5/23/2019
Test Type:	**Conducted Emissions**	Time:	15:42:23
Tested By:	S. Yamamoto	Sequence#:	5
Software:	EMITest 5.03.12		120Vac 60Hz/240Vac 60Hz

Equipment Tested:

Device	Manufacturer	Model #	S/N
Configuration 1			

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 1			

Test Conditions / Notes:

The equipment under test (EUT) consists of an exciter, controller, power amplifier and band-pass filter. The connections are as follows:

RS-232 to RS-485 adapter to RS-485 cable connected from exciter REMOTE 1 to controller ERS485 A.
RS-485 cable connected from controller PRS4851 to power amplifier RS485.
Exciter RF OUT to controller RF IN A via coaxial cable.
Exciter Feedback RF IN A to BPF Output directional coupler fwd port via coaxial cable.
Exciter Feedback RF IN B to BPF Input directional coupler fwd port via coaxial cable.
Controller RF OUT 2 to power amplifier RF IN via coaxial cable.
Controller REFL IN port to power amplifier output directional coupler refl port via coaxial cable.
Controller FWD IN port to power amplifier output directional coupler fwd port via coaxial cable.
Power amplifier directional coupler output to directional coupler at input of BPF via coaxial cable.
BPF directional coupler output to high power attenuator via coaxial cable.
The exciter is setup on channel 5 (79MHz). Test levels are both 100W and 500W output.

The RF OUT of the amplifier is connected to the spectrum analyzer via two high power attenuators. (note the band pass filter is NOT installed for this measurement,)

Recoded measurement is corrected with respect to attenuation of the Band Pass Filter as determined from separate insertion loss measurement.

Frequency range of test 9kHz to 800MHz.
Measurement bandwidth = 500kHz
Voltage to the exciter and controller 120Vac 60Hz.
Voltage to the power amplifier 240Vac 60Hz.

This data sheet is for **100W output power.**
Temperature: 20°C, Humidity: 54%, Pressure: 99kPa.

Test Location:	CKC Laboratories Inc. • 110 N Olinda Pl • Brea CA 92823 • 714 993-6112		
Customer:	**Anywave Communication Technologies Inc.**		
Specification:	**74.794(a)(2)(ii) Radiated Spurious Emissions**		
Work Order #:	**102474**	Date:	5/28/2019
Test Type:	**Maximized Emissions**	Time:	17:33:41
Tested By:	S. Yamamoto	Sequence#:	20
Software:	EMITest 5.03.12		

Equipment Tested:

Device	Manufacturer	Model #	S/N
Configuration 1			

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 1			

Test Conditions / Notes:

The equipment under test (EUT) consists of an exciter, controller, power amplifier and band-pass filter. The connections are as follows:

Power amplifier and controller LAN port to Ethernet switch via cat 5E UTP.
Exciter Remote2 port to Ethernet switch via cat 5E UTP.
RS-232 to RS-485 adapter to RS-485 cable connected from exciter REMOTE 1 to controller ERS485 A.
RS-485 cable connected from controller PRS4851 to power amplifier RS485.
Exciter RF OUT to controller RF IN A via coaxial cable.
Exciter Feedback RF IN A to BPF Output directional coupler fwd port via coaxial cable.
Exciter Feedback RF IN B to BPF Input directional coupler fwd port via coaxial cable.
Controller RF OUT 2 to power amplifier RF IN via coaxial cable.
Controller REFL IN port to power amplifier output directional coupler refl port via coaxial cable.
Controller FWD IN port to power amplifier output directional coupler fwd port via coaxial cable.
Power amplifier directional coupler output to directional coupler at input of BPF via coaxial cable.
BPF directional coupler output to high power attenuator via coaxial cable.
The exciter is setup on channel 5 (79MHz).

Frequency range of test 9kHz to 1000MHz. 9kHz to 150kHz, RBW=200Hz, VBW=1kHz.150kHz to 30MHz, RBW=9kHz, VBW=30kHz .30M-1000MHz, RBW=120kHz, VBW=1.2MHz.
Test data adjustment is for 120kHz reference bandwidth to 500kHz reference bandwidth
Voltage to the exciter and controller 120Vac 60Hz.
Voltage to the power amplifier 240Vac 60Hz.

Test method ANSI C63.4 2014.
Temperature: 21C, Humidity: 45%, Pressure: 99kPa. Site D.

Channel 5. Center Frequency 79MHz.
500 Watt Output.

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dBµV/m, the spectrum analyzer reading in dBµV was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS		
	Meter reading	(dBµV)
+	Antenna Factor	(dB/m)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dBµV/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
