## Laboratory Introduction

SIEMIC, headquartered in the heart of Silicon Valley, with superior facilities in US and Asia, is one of the leading independent testing and certification facilities providing customers with one-stop shop services for Compliance Testing and Global Certifications.

In addition to [testing](#) and [certification](#), SIEMIC provides initial design reviews and [compliance management](#) through out a project. Our extensive experience with [China](#), [Asia Pacific](#), [North America](#), [European](#), and [international](#) compliance requirements, assures the fastest, most cost effective way to attain regulatory compliance for the [global markets](#).

### Accreditations for Conformity Assessment

# 1 EXECUTIVE SUMMARY & EUT INFORMATION

**The purpose of this test programmed was to demonstrate compliance of the SUMEC MACHINERY & ELECTRIC CO.,LTD. The REMOTE CONTROLLER and model: RC-1 against the current Stipulated Standards. The REMOTE CONTROLLER has demonstrated compliance with the FCC 15.231:2013, ANSI C63.4:2009.**

## EUT Information

<b>EUT Description</b>	<b>REMOTE CONTROLLER</b>
<b>Main Model</b>	<b>RC-1</b>
<b>Serial Model</b>	<b>N/A</b>
<b>Antenna Gain</b>	<b>1 dBi</b>
<b>Input Power</b>	<b>12V DC battery of power supply</b>
<b>Classification Per Stipulated Test Standard</b>	<b>FCC 15.231:2013, ANSI C63.4:2009</b>

### **3 MODIFICATION**

**NONE**

## **4 TEST SUMMARY**

The product was tested in accordance with the following specifications.  
All testing has been performed according to below product classification:

### **Test Results Summary**

Test Standard	Description	Pass / Fail
CFR 47 Part 15.231: 2013		
15.203	Antenna Requirement	Pass
15.207	Conducted Emissions Voltage	N/A
15.231(b)	Fundamental & Radiated Spurious Emission	Pass
15.231(c)	20dB Bandwidth	Pass
15.231(a)(1)	Deactivation	Pass
ANSI C63.4: 2009		
PS: All measurement uncertainties are not taken into consideration for all presented test result.		

## **5 MEASUREMENTS, EXAMINATION AND DERIVED RESULTS**

### **5.1 Antenna Requirement**

**Requirement(s):** 47 CFR §15.203

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

Antenna requirement must meet at least one of the following:

- a) Antenna must be permanently attached to the device.
- b) Antenna must use a unique type of connector to attach to the device.
- c) Device must be professionally installed. Installer shall be responsible for ensuring that the correct antenna is employed with the device.

The antenna is permanently attached to the device which meets the requirement.

## **5.2 Conducted Emissions Voltage**

Requirement:

Frequency of emission (MHz)	Conducted limit (dB $\mu$ V)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

\*Decreases with the logarithm of the frequency.

### **Procedures:**

1. All possible modes of operation were investigated. Only the 6 worst case emissions measured, using the correct CISPR and Average detectors, are reported. All other emissions were relatively insignificant.
2. A "-ve" margin indicates a PASS as it refers to the margin present below the limit line at the particular frequency.
3. Conducted Emissions Measurement Uncertainty  
All test measurements carried out are traceable to national standards. The uncertainty of the measurement at a confidence level of approximately 95% (in the case where distributions are normal), with a coverage factor of 2, in the range 9kHz – 30MHz (Average & Quasi-peak) is  $\pm 3.5$ dB.
4. Environmental Conditions

Temperature	20°C
Relative Humidity	48%
Atmospheric Pressure	1019mbar
5. Test date : N/A  
Tested By : William Long

**Test result: N/A (Batteries operated)**

## 5.4 Radiated Fundamental and Spurious Emission

1. Radiated emissions were measured according to ANSI C63.4. The EUT was set 3 meter away from the measuring antenna. The loop antenna was positioned 1meter above the ground from the center of the loop. The measuring bandwidth was set to 10kHz. All possible modes of operation were investigated. Only the worst case emissions measured, All other emissions were relatively insignificant.
2. A "-ve" margin indicates a PASS as it refers to the margin present below the limit line at the particular frequency.
3. Sample Calculation: Corrected Amplitude=Raw Amplitude(dBuV/m)+ACF(dB)+Cable Loss(dB)-Distance Correction Factor.  
 Sample Calculation:  
 1) Corrected Amplitude= Raw Amplitude(dBuV/m)+ACF(dB)+Cable Loss(dB)-Distance Correction Factor  
 2) Average = peak reading + 20log(duty cycle)
4. Radiated Emissions Measurement Uncertainty  
 All test measurements carried out are traceable to national standards. The uncertainty of the measurement at a confidence level of approximately 95% (in the case where distributions are normal), with a coverage factor of 2, in the range 30MHz – 1GHz( QP only3m & 10m) is +5.6/-4.5dB(for EUTs<0.5m×0.5m×0.5m).In range of 1-40GHz) is ±3.6dB.
5. Environmental Conditions
 

Temperature	20°C
Relative Humidity	50%
Atmospheric Pressure	1009mbar
6. Test date : April 11, 2014  
 Tested By : William Long

**Standard Requirement:**

Fundamental frequency (MHz)	Field strength of fundamental (microvolts/meter)	Field strength of spurious emissions (microvolts/meter)
40.66-40.70	2250	225
70-130	1250	125
130-174	1250 to 3750	125 to 375
174-260	3750	375
260-470	3750-12500	375 to 1250
Above 470	12500	1250

**Test Result:** Pass

**Fundamental Measurement @ 433.988MHz @3 Meter FCC 15.231(a)**

Frequency (MHz)	correct (dBµV/m)	Azimuth	Polarity	Height(m)	Factors(dB)	FCC 15.231(a) Limit (dBµV)	Margin(dB)	Comments
433.988	72.03	156.23	V	2.20	-31.37	100.83	-28.80	Peak
433.988	67.55	-	V	-	-4.48	80.83	-13.27	Ave
433.988	79.85	151.20	H	1.80	-31.37	100.83	-20.98	Peak
433.988	75.37	-	H	-	-4.48	80.83	-5.45	Ave

**Spurious Emissions (<1GHz) Measurement @ 3 Meter FCC 15.231(a)**

Frequency (MHz)	correct (dBµV/m)	Azimuth	Polarity	Height(m)	Factors(dB)	FCC 15.231(a) Limit (dBµV)	Margin(dB)	Comments
867.976	55.33	55.60	V	2.1	-25.03	80.83	-25.50	Pk
867.976	50.85	-	V	-	-4.48	60.83	-9.97	Ave
867.976	60.22	251.02	H	2.6	-25.03	80.83	-20.61	Pk
867.976	55.74	-	H	-	-4.48	60.83	-5.08	Ave

Notes:

1. Duty cycle is 59.73%,  $20\log(\text{duty cycle}) = -4.48\text{dB}$  correction was used to determine the average level from the peak reading. Average = peak reading +  $20\log(\text{duty cycle})$ , Final Average= peak reading -4.48
2. All the data measurement of peak values.
3. FCC Limit for Average Measurement= $41.6667 \times (433.988\text{MHz}) - 7083.3333 = 10999.51\mu\text{V/m} = 80.83\text{dB}\mu\text{V/m}$
4. Average pulsed signal over one complete pulse train or 100 ms time frame if pulse train exceeds 100 ms
5. Maximum average in 100 ms
6. Calculate duty cycle for pulse train or 100 ms
7. Duty cycle =  $(t_1 + t_2 + t_3 + \dots + t_n) / T$  where  $t_n$  = pulse width, T = pulse train length or 100 ms

**Spurious Emissions (>1GHz) Measurement @ 3 Meter FCC 15.231(a)**

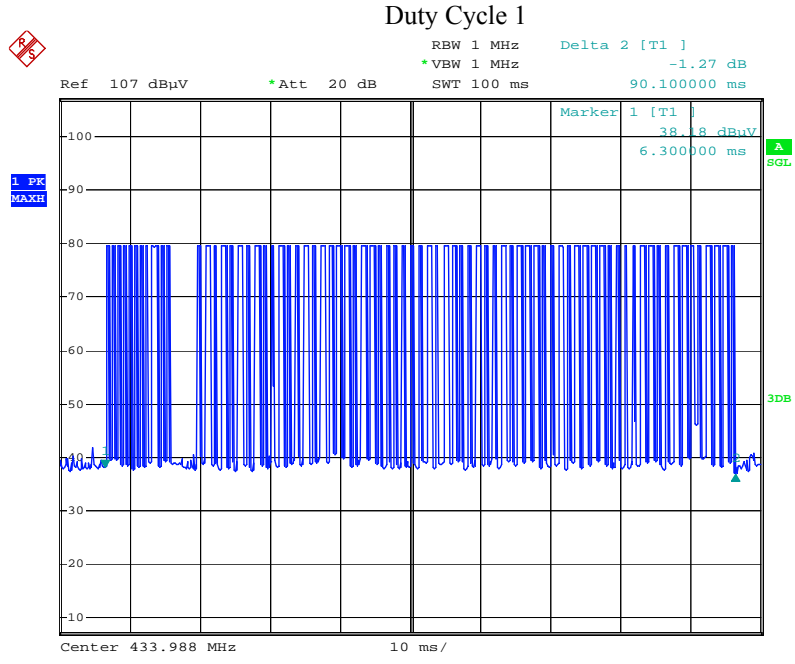

Frequency	Height	Polar	Factors (dB)	Amplifier	correct (dB $\mu$ V/m)	FCC 15.231	Margin	Comments

1735.93	2.3	V	-25.47	55	52.6	80.83	-28.23	Peak
1735.93	-	V	-4.48	-	48.12	60.83	-12.70	Ave
2169.26	1.9	V	-23.17	55	52.69	80.83	-28.14	Peak
2169.26	-	V	-4.48	-	48.21	60.83	-12.61	Ave
3037.89	1.2	V	-19.37	55	47.36	80.83	-33.47	Peak
3037.89	-	V	-4.48	-	42.88	60.83	-17.94	Ave
3472.02	1.6	V	-18.7	55	44.66	80.83	-36.17	Peak
3472.02	-	V	-4.48	-	40.18	60.83	-20.64	Ave
3905.89	1.7	V	-17.63	55	41.56	74.00	-32.44	Peak
3905.89	-	V	-4.48	-	37.08	54.00	-16.92	Ave

Note: Duty cycle is 59.73%,  $20\log(\text{duty cycle}) = -4.48\text{dB}$  correction was used to determine the average level from the peak reading. Average = peak reading +  $20\log(\text{duty cycle})$ , final Average = peak reading -  $4.48\text{dB}$

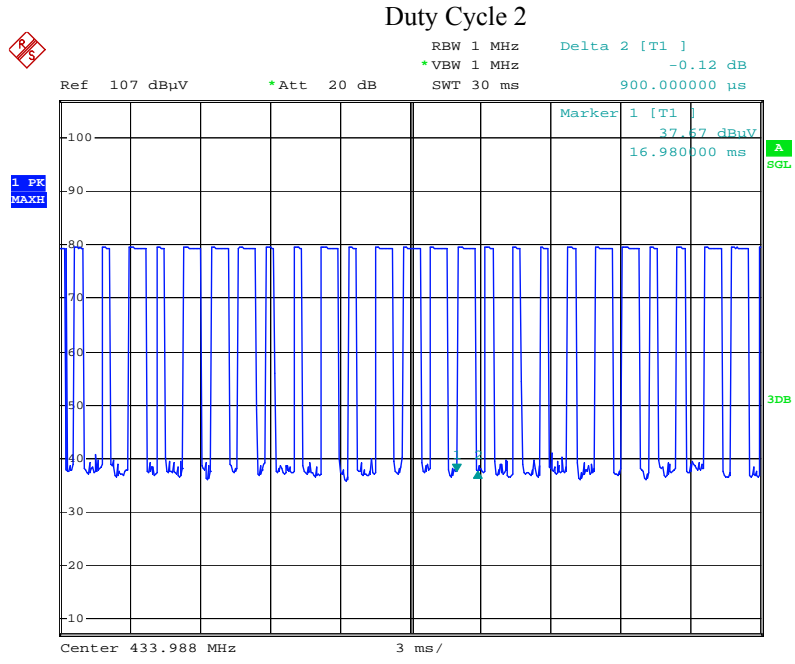

**Note:**

**Pulse width (PW) = 1338ms**  
 **$1/\text{PW} = 1/1338\text{ms} = 0.000747\text{kHz}$**   
**RBW >  $1/\text{PW}$  (0.000747kHz)**  
**Therefore PDCF is not needed.**

Pulse Duty Cycle:  
Wide Pulse: 0.9ms  
Narrow Pulse: 0.54ms  
Duty cycle=  $(0.9 \times 34 + 0.54 \times 43) / 90.1 = 59.73\%$   
Average Duty Factor:  $20 \times \log(\text{Duty Cycle}) = -4.48\text{dB}$

Date: 11.APR.2014 09:03:37

Date: 11.APR.2014 09:05:04

### Duty Cycle 3

Date: 11.APR.2014 09:05:39

## 5.5 Deactivation

- Deactivation was measured by conducted method using a spectrum analyzer.
- Environmental Conditions
 

Temperature	20°C
Relative Humidity	51%
Atmospheric Pressure	1009mbar
- Test Data: April 11, 2014  
 Test By: William Long

Standard requirement: 47 CFR §15.231 (a)(1)  
 Release Time < 5 seconds

Test Result: Pass

Date: 11.APR.2014 09:07:36

**Annex A. ii. RADIATED EMISSIONS TEST DESCRIPTION**

**EUT Characterisation**

EUT characterisation, over the frequency range from 30MHz to 10<sup>th</sup> Harmonic, was done in order to minimise radiated emissions testing time while still maintaining high confidence in the test results.

The EUT was placed in the chamber, at a height of about 0.8m on a turntable. Its radiated emissions frequency profile was observed, using a spectrum analyzer /receiver with the appropriate broadband antenna placed 3m away from the EUT. Radiated emissions from the EUT were maximised by rotating the turntable manually, changing the antenna polarisation and manipulating the EUT cables while observing the frequency profile on the spectrum analyzer / receiver. Frequency points at which maximum emissions occurred, clock frequencies and operating frequencies were then noted for the formal radiated emissions test at the Open Area Test Site (OATS).

**Test Set-up**

1. The EUT and supporting equipment were set up in accordance with the requirements of the standard on top of a 1.5m X 1.0m X 0.8m high, non-metallic table.
2. The filtered power supply for the EUT and supporting equipment were tapped from the appropriate power sockets located on the turntable.
3. The relevant broadband antenna was set at the required test distance away from the EUT and supporting equipment boundary.

**Test Method**

The following procedure was performed to determine the maximum emission axis of EUT:

1. With the receiving antenna is H polarization, rotate the EUT in turns with three orthogonal axes to determine the axis of maximum emission.
2. With the receiving antenna is V polarization, rotate the EUT in turns with three orthogonal axes to determine the axis of maximum emission.
3. Compare the results derived from above two steps. So, the axis of maximum emission from EUT was determined and the configuration was used to perform the final measurement.

**Final Radiated Emission Measurement**

1. Setup the configuration according to figure 1. Turn on EUT and make sure that it is in normal function.
2. For emission frequencies measured below 1 GHz, a pre-scan is performed in a shielded chamber to determine the accurate frequencies of higher emissions will be checked on a open test site. As the same purpose, for emission frequencies measured above 1 GHz, a pre-scan also be performed with a 1 meter measuring distance before final test.
3. For emission frequencies measured below and above 1 GHz, set the spectrum analyzer on a 100 kHz and 1 MHz resolution bandwidth respectively for each frequency measured in step 2.
4. The search antenna is to be raised and lowered over a range from 1 to 4 meters in horizontally polarized orientation. Position the highness when the highest value is indicated on spectrum analyzer, then change the orientation of EUT on test table over a range from 0 ° to 360 ° with a speed as slow as possible, and keep the azimuth that highest emission is indicated on the spectrum analyzer. Vary the antenna position again and record the highest value as a final reading.
5. Repeat step 4 until all frequencies need to be measured were complete.
6. Repeat step 5 with search antenna in vertical polarized orientations.

During the radiated emission test, the Spectrum Analyzer was set with the following configurations:

Frequency Band (MHz)	Function	Resolution bandwidth	Video Bandwidth
30 to 1000	Peak	100 kHz	100 kHz
Above 1000	Peak	1 MHz	1 MHz
	Average	1 MHz	10 Hz

**Sample Calculation Example**

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. For the limit is employed average value, therefore the peak value can be transferred to average value by subtracting the duty factor. The basic equation with a sample calculation is as follows:

$$\text{Peak} = \text{Reading} + \text{Corrected Factor}$$

where

$$\text{Corr. Factor} = \text{Antenna Factor} + \text{Cable Factor} - \text{Amplifier Gain (if any)}$$

And the average value is

$$\text{Average} = \text{Peak Value} + \text{Duty Factor or}$$

$$\text{Set RBW} = 1\text{MHz, VBW} = 10\text{Hz.}$$

Note:

If the measured frequencies are fall in the restricted frequency band, the limit employed must be quasi peak value when frequencies are below or equal to 1 GHz. And the measuring instrument is set to quasi peak detector function.
