# 4. <u>RF Audio Interference Level</u>

FCC wireless hearing aid compatibility rules ensure that consumers with hearing loss are able to access wireless communications services through a wide selection of handsets without experiencing disabling radio frequency (RF) interference or other technical obstacles.

To define and measure the hearing aid compatibility of handsets, in CFR47 part 20.19 ANSI C63.19 is referenced. A handset is considered hearing aid-compatible for acoustic coupling if it meets a rating of at least M3 under ANSI C63.19, and A handset is considered hearing aid compatible for inductive coupling if it meets a rating of at least T3. According to ANSI C63.19 2011 version, for acoustic coupling, the RF electric field emissions of wireless communication devices should be measured and rated according to the emission level as below.

| Emission Cotogorios | E-field emissions |                   |  |  |
|---------------------|-------------------|-------------------|--|--|
| Emission Categories | <960Mhz           | >960Mhz           |  |  |
| M1                  | 50 to 55 dB (V/m) | 40 to 45 dB (V/m) |  |  |
| M2                  | 45 to 50 dB (V/m) | 35 to 40 dB (V/m) |  |  |
| M3                  | 40 to 45 dB (V/m) | 30 to 35 dB (V/m) |  |  |
| M4                  | <40 dB (V/m)      | <30 dB (V/m)      |  |  |

## 6. Modulation Interference Factor

The HAC Standard ANSI C63.19-2011 defines a new scaling using the Modulation Interference Factor (MIF). For any specific fixed and repeatable modulated signal, a modulation interference factor (MIF, expressed in dB) may be developed that relates its interference potential to its steady-state rms signal level or average power level. This factor is a function only of the audio-frequency amplitude modulation characteristics of the signal and is the same for field-strength and conducted power measurements. It is important to emphasize that the MIF is valid only for a specific repeatable audio-frequency amplitude modulation characteristic. Any change in modulation characteristic requires determination and application of a new MIF

The Modulation Interference factor (MIF, in dB) is added to the measured average E-field (in dBV/m) and converts it to the RF Audio Interference level (in dBV/m). This level considers the audible amplitude modulation components in the RF E-field. CW fields without amplitude modulation are assumed to not interfere with the hearing aid electronics. Modulations without time slots and low fluctuations at low frequencies have low MIF values, TDMA modulations with narrow transmission and repetition rates of few 100 Hz have high MIF values and give similar classifications as ANSI C63.19-2011.

ER3D, EF3D and EU2D E-field probes have a bandwidth <10 kHz and can therefore not evaluate the RF envelope in the full audio band. DASY52 is therefore using the indirect measurement method according to ANSI C63.19-2011 which is the primary method. These near field probes read the averaged E-field measurement. Especially for the new high peak-to-average (PAR) signal types, the probes shall be linearized by PMR calibration in order to not overestimate the field reading. Probe Modulation Response (PMR) calibration linearizes the probe response over its dynamic range for specific modulations which are characterized by their UID and result in an uncertainty specified in the probe calibration certificate. The MIF is characteristic for a given waveform envelope and can be used as a constant conversion factor if the probe has been PMR calibrated.

The evaluation method for the MIF is defined in ANSI C63.19-2011 section D.7. An RMS demodulated RF signal is fed to a spectral filter (similar to an A weighting filter) and forwarded to a temporal filter acting as a quasi-peak detector. The averaged output of these filtering is scaled to a 1 kHz 80% AM signal as reference. MIF measurement requires additional instrumentation and is not well suited for evaluation by the end user with reasonable uncertainty. It may alliteratively be determined through analysis and simulation, because it is constant and characteristic for a communication signal. DASY52 uses well-defined signals for PMR calibration. The MIF of these signals has been determined by simulation and it is automatically applied.

The MIF measurement uncertainty is estimated as follows, declared by HAC equipment provider SPEAG, for modulation frequencies from slotted waveforms with fundamental frequency and at least 2 harmonics within 10 kHz:

- 1. 0.2 dB for MIF: -7 to +5 dB
- 2. 0.5 dB for MIF: -13 to +11 dB
- 3. 1 dB for MIF: > -20 dB

MIF values applied in this test report were provided by the HAC equipment provider of SPEAG, and the worst values for all air interface are listed below to be determine the Low-power Exemption.

| UID   | Communication System Name                   | MIF(dB) |
|-------|---|---------|
| 10173 | 5G NR (CP-OFDM, 1 RB, 15 MHz, QPSK, 15 kHz) | -12.08  |

## 7. Low-power Exemption

#### <Max Tune-up Limit>

| М         | ode     | Average Power (dBm) |      |  |
|-----------|---------|---------------------|------|--|

|           | Band 71 | 24                  | 24   |  |
| 5G NR TDD | TDD B41 | 24.8                |      |  |

#### <Low Power Exemption>

| Air Interface |     | Max Average<br>Antenna Input<br>Power (dBm) | Worst Case<br>MIF (dB) | Power +<br>MIF(dB) | C63.19 test<br>required |
|---------------|-----|---|------------------------|--------------------|-------------------------|
| 5G NR - FDD   | UAT | 24.00                                       | -12.08                 | 11.92              | No                      |
| 5G NR - FDD   | LAT | 24.00                                       | -12.08                 | 11.92              | No                      |
| 5G NR - TDD   | UAT | 24.80                                       | -12.08                 | 12.72              | No                      |

#### General Note:

1. According to ANSI C63.19 2011-version, for the air interface technology of a device is exempt from testing when its average antenna input power plus its MIF is ≤17 dBm for any of its operating modes.

2. HAC RF rating is M4 for the air interface which meets the low power exemption.
