1. Module Overview

1.1 Features

MCU

- ESP32-S2 embedded, Xtensa® single-core 32-bit LX7 microprocessor, up to 240 MHz
- 128 KB ROM
- 320 KB SRAM
- 16 KB SRAM in RTC

Wi-Fi

- 802.11 b/g/n
- Bit rate: 802.11n up to 150 Mbps
- A-MPDU and A-MSDU aggregation
- 0.4 μ s guard interval support
- Operating frequency range: 2412 ~ 2462 MHz

Hardware

- Interfaces: GPIO, SPI, LCD, UART, I²C, I²S, Camera interface, IR, pulse counter, LED PWM, USB OTG 1.1, ADC, DAC, touch sensor, temperature sensor
- 40 MHz crystal oscillator
- 4 MB SPI flash
- 2 MB PSRAM
- Operating voltage/Power supply: 3.0 ~ 3.6 V
- Operating temperature range: -40 ~ 85 °C
- Dimensions: (18 × 31 × 3.3) mm

Certification

- Green certification: RoHS/REACH

Test

- HTOL/HTSL/uHAST/TCT/ESD

1.2 Description

ESP32-S2-WROVER is a powerful, generic Wi-Fi MCU module that has a rich set of peripherals. This module is an ideal choice for a wide variety of application scenarios relating to Internet of Things (IoT), wearable electronics and smart home.

This module is provided in two versions: one with a PCB antenna, the other with an Dipole antenna.

ESP32-S2-WROVER features a 4 MB external SPI flash and an additional 2 MB SPI Pseudo static RAM (PSRAM).

The information in this datasheet is applicable to both modules.

The ordering information on the two variants of ESP32-S2-WROVER is listed as follows:

Table 1: ESP32-S2-WROVER Ordering Information

Module	Chip embedded	Flash	PSRAM	Module dimensions (mm)
ESP32-S2-WROVER (PCB)	ESP32-S2	4 MB	2 MB	(18.00±0.10)×(31.00±0.10)×(3.30±0.10)
ESP32-S2-WROVER-I (Dipole)				
Notes: The module with various capacities of flash or flash is available for custom order.				

At the core of this module is ESP32-S2 *, an Xtensa® 32-bit LX7 CPU that operates at up to 240 MHz. The user

can power off the CPU and make use of the low-power co-processor to constantly monitor the peripherals for changes or crossing of thresholds. ESP32-S2 integrates a rich set of peripherals, ranging from SPI, I²S, UART, I²C, LED PWM, ADC, DAC, touch sensor, temperature sensor, as well as up to 43 GPIOs. It also includes a full-speed USB On-The-Go (OTG) interface to enable USB communication.

Note:

* For more information on ESP32-S2, please refer to [ESP32-S2 Datasheet](#).

1.3 Applications

- Generic Low-power IoT Sensor Hub
- Generic Low-power IoT Data Loggers
- Cameras for Video Streaming
- Over-the-top (OTT) Devices
- USB Devices
- Speech Recognition
- Image Recognition
- Mesh Network
- Home Automation
- Smart Home Control Panel
- Smart Building
- Industrial Automation
- Smart Agriculture
- Audio Applications
- Health Care Applications
- Wi-Fi-enabled Toys
- Wearable Electronics
- Retail & Catering Applications
- Smart POS Machines

Notice:

- By default, IO26 is connected to the CS side of the PSRAM. If PSRAM is not a must, IO26 can be used as a regular GPIO.
- For peripheral pin configurations, please refer to [ESP32-S2 Datasheet](#).

3.3 Strapping Pins

ESP32-S2 has three strapping pins: GPIO0, GPIO45, GPIO46. The pin-pin mapping between ESP32-S2 and the module is as follows, which can be seen in Chapter 5 *Schematics*:

- GPIO0 = IO0
- GPIO45 = IO45
- GPIO46 = IO46

Software can read the values of corresponding bits from register "GPIO_STRAPPING".

During the chip's system reset (power-on-reset, RTC watchdog reset, brownout reset, analog super watchdog reset, and crystal clock glitch detection reset), the latches of the strapping pins sample the voltage level as strapping bits of "0" or "1", and hold these bits until the chip is powered down or shut down.

IO0, IO45 and IO46 are connected to the internal pull-up/pull-down. If they are unconnected or the connected external circuit is high-impedance, the internal weak pull-up/pull-down will determine the default input level of these strapping pins.

To change the strapping bit values, users can apply the external pull-down/pull-up resistances, or use the host MCU's GPIOs to control the voltage level of these pins when powering on ESP32-S2.

After reset, the strapping pins work as normal-function pins.

Refer to Table 3 for a detailed boot-mode configuration of the strapping pins.

Table 3: Strapping Pins

VDD_SPI Voltage ¹			
Pin	Default	3.3 V	1.8 V
IO45 ²	Pull-down	0	1

Pin	Default	SPI Boot	Download Boot
IO0	Pull-up	1	0
IO46	Pull-down	Don't-care	0
Enabling/Disabling ROM Code Print During Bootling ^{3 4}			
Pin	Default	Enabled	Disabled
IO46	Pull-down	See the fourth note	See the fourth note

Note:

1. Firmware can configure register bits to change the settings of "VDD_SDIO Voltage".
2. Internal pull-up resistor (R1) for IO45 is not populated in the module, as the flash and SRAM in ESP32-S2-WROVER work at 3.3 V by default (output by VDD_SPI). Please make sure IO45 will not be pulled high when the module is powered up by external circuit.
3. ROM code can be printed over TXD0 (by default) or DAC_1 (IO17), depending on the eFuse bit.
4. When eFuse UART_PRINT_CONTROL value is:
 - 0, print is normal during boot and not controlled by IO46.
 - 1 and IO46 is 0, print is normal during boot; but if IO46 is 1, print is disabled.
 - 2 and IO46 is 0, print is disabled; but if IO46 is 1, print is normal.
 - 3, print is disabled and not controlled by IO46.

Note:

VDD is the I/O voltage for a particular power domain of pins.

4.4 Current Consumption Characteristics

With the use of advanced power-management technologies, ESP32-S2-WROVER can switch between different power modes. For details on different power modes, please refer to Section *RTC and Low-Power Management* in [ESP32-S2 Datasheet](#).

The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitters' measurements are based on a 50% duty cycle.

Table 7: Current Consumption Depending on RF Modes

Work mode	Description		Average	Peak
Active (RF working)	TX	802.11b, 20 MHz, 1 Mbps, @21.14 dBm	190 mA	310 mA
		802.11g, 20 MHz, 54 Mbps, @22.75dBm	145 mA	220 mA
		802.11n, 20 MHz, MCS7, @23.06dBm	135 mA	200 mA
		802.11n, 40 MHz, MCS7, @22.53 dBm	120 mA	160 mA
	RX	802.11b/g/n, 20 MHz	63 mA	63 mA
		802.11n, 40 MHz	68 mA	68 mA

Note:

The current consumption figures for in RX mode are for cases when the peripherals are disabled and the CPU idle.

Table 8: Current Consumption Depending on Work Modes

Work mode	Description		Power consumption (Typ)
Modem-sleep	The CPU is powered on	240 MHz	21 mA
		160 MHz	17 mA
		Normal speed: 80 MHz	14 mA
Light-sleep	—		550 μ A
Deep-sleep	The ULP co-processor is powered on.		220 μ A
	ULP sensor-monitored pattern		7 μ A @1% duty
	RTC timer + RTC memory		10 μ A
	RTC timer only		5 μ A
Power off	CHIP_PU is set to low level, the chip is powered off.		0.5 μ A

Note:

- The current consumption figures in Modem-sleep mode are for cases where the CPU is powered on and the cache idle.
- When Wi-Fi is enabled, the chip switches between Active and Modem-sleep modes. Therefore, current consumption changes accordingly.
- In Modem-sleep mode, the CPU frequency changes automatically. The frequency depends on the CPU load and the peripherals used.
- During Deep-sleep, when the ULP co-processor is powered on, peripherals such as GPIO and I²C are able to operate.
- The "ULP sensor-monitored pattern" refers to the mode where the ULP coprocessor or the sensor works periodically. When touch sensors work with a duty cycle of 1%, the typical current consumption is 7 μ A.

7. Physical Dimensions and PCB Land Pattern

7.1 Physical Dimensions

Figure 5: ESP32-S2-WROVER Physical Dimensions

Note:

- Soldering the EPAD to the ground of the base board is not a must, though doing so can get optimized thermal performance. If users do want to solder it, they need to ensure that the correct quantity of soldering paste is applied.
- To ensure the power supply to the ESP32-S2 chip during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually $R = 10\text{ k}\Omega$ and $C = 0.1\text{ }\mu\text{F}$. However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32-S2's power-up and reset sequence timing diagram, please refer to Section *Power Scheme* in [ESP32-S2 Datasheet](#).

7.2 Recommended PCB Land Pattern

Figure 6: Recommended PCB Land Pattern

8. Product Handling

8.1 Storage Condition

The products sealed in Moisture Barrier Bag (MBB) should be stored in a noncondensing atmospheric environment of $< 40^{\circ}\text{C}/90\%\text{RH}$.

MSL 3 and floorlife: 168 hrs $30^{\circ}\text{C}/60\%\text{RH}$

8.2 ESD

- Human body model (HBM): 2000 V
- Charged-device model (CDM): 500 V
- Air discharge: 8000 V
- Contact discharge: 6000 V

8.3 Reflow Profile

Figure 7: Reflow Profile

9. MAC Addresses and eFuse

The eFuse in ESP32-S2 has been burnt into 48-bit `mac_address`. The actual addresses the chip uses in station and AP modes correspond to `mac_address` in the following way:

- Station mode: `mac_address`
- AP mode: `mac_address + 1`

There are seven blocks in eFuse for users to use. Each block is 256 bits in size and has independent write/read disable controller. Six of them can be used to store encrypted key or user data, and one is only used to store user data.

FCC Statement

Any Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

(1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment .This equipment should be installed and operated with minimum distance 20cm between the radiator& your body.

Regulatory Module Integration Instructions

2.2 List of applicable FCC rules

This device complies with part 15.247 of the FCC Rules.

2.3 Summarize the specific operational use conditions

This module can be used in household electrical appliances as well as lighting equipments. The input voltage to the module should be nominally 3.0~3.6 V_{DC} ,typical value 3.3V_{DC} and the ambient temperature of the module should not exceed 85°C.

This module using two kinds of antennas ,PCB antenan with maximum gain is 3.40dBi . Dipole antenan with maximum gain is 2.33dBi .Other antenna arrangement is not covered by this certification.The antenna is not field replaceable. If the antenna needs to be changed, the certification should be re-applied.

2.4 Limited module procedures

Not applicable

2.5 Trace antenna designs

Not applicable

2.6 RF exposure considerations

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment .This equipment should be installed and operated with minimum distance 20cm between the radiator& your body. If the device built into a host as a portable usage, the additional RF exposure evaluation may be required as specified by§ 2.1093.

2.7 Antennas

Module contains one PCB antenna and Dipole antenna.

2.8 Label and compliance information

The outside of final products that contains this module device must display a label referring to the enclosed module. This exterior label can use wording such as: "Contains Transmitter Module FCC ID: 2AC7Z-ESP32S2WROVER ", or "Contains FCC ID: 2AC7Z-ESP32S2WROVER ", Any similar wording that expresses the same meaning may be used.

2.9 Information on test modes and additional testing requirements

a) The modular transmitter has been fully tested by the module grantee on the required number of channels, modulation types, and modes, it should not be necessary for the host installer to re-test all the available transmitter modes or settings. It is recommended that the host product manufacturer, installing the modular transmitter, perform some investigative measurements to confirm that the resulting composite system does not exceed the spurious emissions limits or band edge limits (e.g., where a different antenna may be causing additional emissions).

b) The testing should check for emissions that may occur due to the intermixing of emissions with the other transmitters, digital circuitry, or due to physical properties of the host product (enclosure). This investigation is especially important when integrating multiple modular transmitters where the certification is based on testing each of them in a stand-alone configuration. It is important to note that host product manufacturers should not assume that because the modular transmitter is certified that they do not

have any responsibility for final product compliance.

c) If the investigation indicates a compliance concern the host product manufacturer is obligated to mitigate the issue. Host products using a modular transmitter are subject to all the applicable individual technical rules as well as to the general conditions of operation in Sections 15.5, 15.15, and 15.29 to not cause interference. The operator of the host product will be obligated to stop operating the device until the interference has been corrected

Below are steps for TX verification :

```
wpriv mp_start //enter MP mode

iwpriv mp_channel 1 //set channel to 1 . 2, 3, 4~11 etc.

iwpriv mp_bandwidth 40M=0,shortGI=0 //40M=0 set 20M mode and long GI ,
                                     40M=1 set 40M mode

iwpriv mp_ant_tx a //select antenna A for operation

iwpriv mp_txpower patha=44,pathb=44 //set path A and path B Tx power level

iwpriv mp_rate 108 //set OFDM data rate to 54Mbps,ex:
CCK 1M = 2, CCK 5.5M = 11, KK, OFDM54M = 108 N Mode: MCS0 = 128, MCS1
= 129.....etc.

iwpriv mp_ctx background,pkt //start packet continuous Tx

iwpriv mp_ctx stop //stop continuous Tx
```

2.10 Additional testing, Part 15 subpart B disclaimer

The final host / module combination need to be evaluated against the FCC Part 15B criteria for unintentional radiators in order to be properly authorized for operation as a Part 15 digital device.

The host integrator installing this module into their product must ensure that the final composite product complies with the FCC requirements by a technical assessment or evaluation to the FCC rules, including the transmitter operation and should refer to guidance in KDB 996369.

Frequency spectrum to be investigated

For host products with certified modular transmitter, the frequency range of investigation of the composite system is specified by rule in Sections 15.33(a)(1) through (a)(3), or the range applicable to the digital device, as shown in Section 15.33(b)(1), whichever is the higher frequency range of investigation.

Operating the host product

When testing the host product, all the transmitters must be operating. The transmitters can be enabled by using publicly-available drivers and turned on, so the transmitters are active. In certain conditions it might be appropriate to use a technology-specific call box (test set) where accessory devices or drivers are not available.

When testing for emissions from the unintentional radiator, the transmitter shall be placed in the receive mode or idle mode, if possible. If receive mode only is not possible then, the radio shall be passive (preferred) and/or active scanning. In these cases, this would need to enable activity on the communication BUS (i.e., PCIe, SDIO, USB) to ensure the unintentional radiator circuitry is enabled. Testing laboratories may need to add attenuation or filters depending on the signal strength of any active beacons (if applicable) from the enabled radio(s). See ANSI C63.4, ANSI C63.10 and ANSI C63.26 for further

general testing details.
