## ANNEX I Sensor Triggering Data Summary

| Antenna number | Sensing surface | Trigger distance N |
| :---: | :---: | :---: |
| ANT1 | Back | 16 mm |
|  | Top | 16 mm |
|  | Back | 16 mm |
|  | Bottom | 16 mm |
| ANT5 | Back | 16 mm |
|  | Left | 16 mm |
| ANT7 | Back | 16 mm |
|  | Right | 16 mm |

Rear, Top, Bottom, Left and Right of the DUT was placed directly below the flat phantom. The DUT was moved toward the phantom in accordance with the steps outlined in KDB 616217 to determine the trigger distance for enabling power reduction. The DUT was moved away from the phantom to determine the trigger distance for resuming full power.

TTL

| Main antenna | Low | Low | Low | Low | Low | Low | Normal | Normal | Normal | Normal | Normal |

Per FCC KDB Publication 616217 D04v01r02, the influence of table tilt angles to proximity sensor triggering is determined by positioning each edge that contains a transmitting antenna, perpendicular to the flat phantom, at the smallest sensor triggering test distanceby rotating the device around the edge next to the phantom in $\leq 10^{\circ}$ increments until the tablet is $\pm 45^{\circ}$ or more from the vertical position at $0^{\circ}$.

The Back evaluation for ANT1/3/5/7

The Top edge evaluation for ANT1

The Bottom edge evaluation for ANT3

The Left edge evaluation for ANT5

## The Right edge evaluation for ANT7

Based on the above evaluation, we come to the conclusion that the sensor triggering is not released and normal maximum output power is not restored within the $\pm 45^{\circ}$ range at the smallest sensor triggering test distance declared by manufacturer.
