### 2 Statement of Compliance

The maximum results of Specific Absorption Rate (SAR) found during testing for TCL Communication Ltd. GSM mobile phone T301P,T301Q are as follows:

<b>3  - (3</b> )				
Mode		Highest Reported SAR (1g)		
		1g SAR	1g SAR	
		Head	Body	
GSM	GSM850	0.88	1.02	
GSIVI	GSM1900	0.60	0.72	
BT		0.02	<0.01	

#### Table 2.1: Highest Reported SAR (1g)

The SAR values found for the Mobile Phone are below the maximum recommended levels of 1.6 W/kg as averaged over any 1g tissue according to the ANSI C95.1-1992.

For body operation, this device has been tested and meets FCC RF exposure guidelines when used with any accessory that contains no metal and which provides a minimum separation distance of 10 mm between this device and the body of the user. Use of other accessories may not ensure compliance with FCC RF exposure guidelines.

The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power output.

T The maximum SAR value is obtained at the case of **(Table 2.1)**, and the values are:

Head: 0.88 W/kg (1g) Body: 1.02 W/kg (1g)

	Position	Main antenna	BT	Sum
Highest SAR value for Head	Left head, Cheek	0.88 (GSM850)	0.02	0.90
Highest SAR value for Body	Rear 10mm	1.02 (GSM850)	<0.01	1.02

Table 2.2: The sum of SAR values for Main antenna +BT

According to the above tables, the highest sum of reported SAR values is **1.02 W/kg (1g)**. The detail for simultaneous transmission consideration is described in chapter 14.

#### Conclusion:

According to the above tables, the sum of reported SAR values is<1.6W/kg. So the simultaneous transmission SAR with volume scans is not required.

### **3 Client Information**

### 4 Equipment Under Test (EUT) and Ancillary Equipment (AE)

#### 4.1 About EUT

Description:	Feature phone
Model name:	T301P,T301Q
Tested Band:	GSM850/900/1800/1900, BT
	824 – 849 MHz (GSM 850)
Tx Frequency:	1850 – 1910 MHz (GSM 1900)
	2400 – 2483.5 MHz (Bluetooth)
GPRS/EGPRS Multislot Class:	12
Test device production information:	Production unit
Device type:	Portable device
Antenna type:	Integrated antenna
Hotspot mode:	Not Support

#### 4.2 Internal Identification of EUT used during the test

EUT ID*	IMEI	HW Version	SW Version
EUT1	358894697411068/358894697415069	C685_MB_V1.0	T301P_CE_V1.0_20221108
EUT2	358894697411175/358894697415176	C685_MB_V1.0	T301P_CE_V1.0_20221108

\*EUT ID: is used to identify the test sample in the lab internally.

**Note:** It is performed to test SAR with the EUT1 and conducted power with the EUT2.

#### 4.3 Internal Identification of AE used during the test

AE ID*	Description	Model	SN	Manufacturer
AE1	Battery	TLi010CA	/	ТМВ
AE2	Headset	WH15	/	JUWEI

\*AE ID: is used to identify the test sample in the lab internally.

### **5 TEST METHODOLOGY**

#### 5.1 Applicable Limit Regulations

**ANSI C95.1–1992:**IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz.

It specifies the maximum exposure limit of **1.6 W/kg** as averaged over any 1 gram of tissue for portable devices being used within 20 cm of the user in the uncontrolled environment.

#### 5.2 Applicable Measurement Standards

**IEEE 1528–2013:** Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques.

**KDB447498 D01: General RF Exposure Guidance v06:** Mobile and Portable Devices RF Exposure Procedures and Equipment Authorization Policies.

KDB941225 D05 SAR for LTE Devices v02r05: SAR Evaluation Considerations for LTE Devices

**KDB865664 D01 SAR measurement 100 MHz to 6 GHz v01r04:** SAR Measurement Requirements for 100 MHz to 6 GHz.

**KDB865664 D02 RF Exposure Reporting v01r02:** RF Exposure Compliance Reporting and Documentation Considerations

### 6 Specific Absorption Rate (SAR)

#### 6.1 Introduction

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

#### 6.2 SAR Definition

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density ( $\rho$ ). The equation description is as below:

$$SAR = \frac{d}{dt}(\frac{dW}{dm}) = \frac{d}{dt}(\frac{dW}{\rho dv})$$

SAR is expressed in units of Watts per kilogram (W/kg) SAR measurement can be either related to the temperature elevation in tissue by

$$SAR = c(\frac{\delta T}{\delta t})$$

Where: C is the specific head capacity,  $\delta T$  is the temperature rise and  $\delta t$  is the exposure duration, or related to the electrical field in the tissue by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

Where:  $\sigma$  is the conductivity of the tissue,  $\rho$  is the mass density of tissue and E is the RMS electrical field strength.

However for evaluating SAR of low power transmitter, electrical field measurement is typically applied.

### 7 Tissue Simulating Liquids

#### 7.1 Targets for tissue simulating liquid

#### Table 7.1: Targets for tissue simulating liquid

Frequency(MHz)	Liquid Type	Conductivity(σ)	± 5% Range	Permittivity(ε)	± 5% Range
835	Head	0.90	0.81~0.99	41.5	37.35~45.65
1900	Head	1.40	1.33~1.47	40.0	38.0~42.0
2450	Head	1.80	1.62~1.98	39.2	35.28~43.12

### 7.2 Dielectric Performance

#### Table 7.2: Dielectric Performance of Tissue Simulating Liquid

Measurement Date	Туро	Frequency	Permittivity	Drift	Conductivity	Drift
(yyyy-mm-dd)	Туре	Frequency	٤	(%)	σ (S/m)	(%)
2022/12/15	Head	835MHz	42.86	3.28%	0.945	-2.58%
2022/12/16	Head	1900 MHz	41.25	3.13%	1.376	-1.71%
2022/12/17	Head	2450 MHz	40.11	2.32%	1.823	1.28%

Note: The liquid temperature is 22.0°C

Picture 7-1 Liquid depth in the Head Phantom

Picture 7-2 Liquid depth in the Flat Phantom

### 8 System verification

#### 8.1 System Setup

In the simplified setup for system evaluation, the DUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave that comes from a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The equipment setup is shown below:

Picture 8-1 System Setup for System Evaluation

Picture 8-2 Photo of Dipole Setup

©Copyright. All rights reserved by CTTL.

#### 8.2 System Verification

SAR system verification is required to confirm measurement accuracy, according to the tissue dielectric media, probe calibration points and other system operating parameters required for measuring the SAR of a test device. The system verification must be performed for each frequency band and within the valid range of each probe calibration point required for testing the device. The system verification results are required that the area scan estimated 1-g SAR is within 3% of the zoom scan 1-g SAR. The details are presented in annex B.

Measurement		Target val	ue (W/kg)	Measured	value(W/kg)	Deviation		
Date	Frequency	10 g	1 g	10 g	1 g	10 g	1 g	
(yyyy-mm-dd)		Average	Average	Average	Average	Average	Average	
2022/12/15	835MHz	6.34	9.73	6.20	9.36	-2.21%	-3.80%	
2022/12/16	1900 MHz	20.7	39.7	21.00	40.32	1.45%	1.56%	
2022/12/17	2450 MHz	24.9	52.7	25.5	54.6	2.49%	3.61%	

### **9 Measurement Procedures**

#### 9.1 Tests to be performed

In order to determine the highest value of the peak spatial-average SAR of a handset, all device positions, configurations and operational modes shall be tested for each frequency band according to steps 1 to 3 below. A flowchart of the test process is shown in picture 9.1.

Step 1: The tests described in 9.2 shall be performed at the channel that is closest to the centre of

the transmit frequency band ( $f_c$ ) for:

a) all device positions (cheek and tilt, for both left and right sides of the SAM phantom, as described in annex D),

b) all configurations for each device position in a), e.g., antenna extended and retracted, and

c) all operational modes, e.g., analogue and digital, for each device position in a) and configuration in b) in each frequency band.

If more than three frequencies need to be tested according to 11.1 (i.e.,  $N_c$  > 3), then all

frequencies, configurations and modes shall be tested for all of the above test conditions.

**Step 2**: For the condition providing highest peak spatial-average SAR determined in Step 1,perform all tests described in 9.2 at all other test frequencies, i.e., lowest and highest frequencies. In addition, for all other conditions (device position, configuration and operational mode) where the peak spatial-average SAR value determined in Step 1 is within3 dB of the applicable SAR limit, it is recommended that all other test frequencies shall be tested as well.

**Step 3**: Examine all data to determine the highest value of the peak spatial-average SAR found in Steps 1 to 2.

#### 9.2 General Measurement Procedure

The area and zoom scan resolutions specified in the table below must be applied to the SAR measurements and fully documented in SAR reports to qualify for TCB approval. Probe boundary effect error compensation is required for measurements with the probe tip closer than half a probe tip diameter to the phantom surface. Both the probe tip diameter and sensor offset distance must satisfy measurement protocols; to ensure probe boundary effect errors are minimized and the higher fields closest to the phantom surface can be correctly measured and extrapolated to the phantom surface for computing 1-g SAR. Tolerances of the post-processing algorithms must be verified by the test laboratory for the scan resolutions used in the SAR measurements, according to the reference distribution functions specified in IEEE Std 1528-2003. The results should be documented as part of the system validation records and may be requested to support test results when all the measurement parameters in the following table are not satisfied.

			$\leq$ 3 GHz	> 3 GHz			
Maximum distance from (geometric center of pro		-	$5 \pm 1 \text{ mm}$	$\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5 \text{ mm}$			
Maximum probe angle f normal at the measurem			30°±1°	20°±1°			
			$\leq 2 \text{ GHz:} \leq 15 \text{ mm}$ $2 - 3 \text{ GHz:} \leq 12 \text{ mm}$	$\begin{array}{l} 3-4 \hspace{0.1 cm} \mathrm{GHz:} \leq 12 \hspace{0.1 cm} \mathrm{mm} \\ 4-6 \hspace{0.1 cm} \mathrm{GHz:} \leq 10 \hspace{0.1 cm} \mathrm{mm} \end{array}$			
Maximum area scan spa	tial resoluti	on: Δx <sub>Area</sub> , Δy <sub>Area</sub>	When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be $\leq$ the corresponding x or y dimension of the test device with at least one measurement point on the test device.				
Maximum zoom scan sp	atial resolu	tion: Δx <sub>Zoom</sub> , Δy <sub>Zoom</sub>	$\leq 2 \text{ GHz} \leq 8 \text{ mm}$ 2 - 3 GHz: $\leq 5 \text{ mm}^*$	$3 - 4 \text{ GHz:} \le 5 \text{ mm}^4$ $4 - 6 \text{ GHz:} \le 4 \text{ mm}^4$			
	uniform g	nid: ∆z <sub>Zoom</sub> (n)	≤ 5 mm	$3 - 4 \text{ GHz} \le 4 \text{ mm}$ $4 - 5 \text{ GHz} \le 3 \text{ mm}$ $5 - 6 \text{ GHz} \le 2 \text{ mm}$			
Maximum zoom scan spatial resolution, normal to phantom surface	graded	$\Delta z_{Zoom}(1)$ : between 1 <sup>st</sup> two points closest to phantom surface	≤ 4 mm	3 – 4 GHz: ≤ 3 mm 4 – 5 GHz: ≤ 2.5 mm 5 – 6 GHz: ≤ 2 mm			
	grid	∆z <sub>Zoom</sub> (n>1): between subsequent points	$\leq 1.5 \cdot \Delta z_{Zoom}(n-1)$				
Minimum zoom scan volume	x, y, z	1	≥ 30 mm	$3 - 4 \text{ GHz}$ : $\geq 28 \text{ mm}$ $4 - 5 \text{ GHz}$ : $\geq 25 \text{ mm}$ $5 - 6 \text{ GHz}$ : $\geq 22 \text{ mm}$			
Note: δ is the penetration 2011 for details.	n depth of a	plane-wave at normal inc	idence to the tissue medium; see	draft standard IEEE P1528-			

\* When zoom scan is required and the <u>reported</u> SAR from the area scan based 1-g SAR estimation procedures of KDB 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

#### 9.3 WCDMA Measurement Procedures for SAR

The following procedures are applicable to WCDMA handsets operating under 3GPP Release99, Release 5 and Release 6. The default test configuration is to measure SAR with an established radio link between the DUT and a communication test set using a 12.2kbps RMC (reference measurement channel) configured in Test Loop Mode 1. SAR is selectively confirmed for other physical channel configurations (DPCCH & DPDCH<sub>n</sub>), HSDPA and HSPA (HSUPA/HSDPA) modes according to output power, exposure conditions and device operating capabilities. Both uplink and downlink should be configured with the same RMC or AMR, when required. SAR for Release 5 HSDPA and Release 6 HSPA are measured using the applicable FRC (fixed reference channel) and E-DCH reference channel configurations. Maximum output power is verified according to applicable versions of 3GPP TS 34.121 and SAR must be measured according to these maximum output conditions. When Maximum Power Reduction (MPR) is not implemented according to Cubic Metric (CM) requirements for Release 6 HSPA, the following procedures do not apply.

Sub-test	$eta_{c}$	$oldsymbol{eta}_d$	$eta_d$ (SF)	$eta_c / eta_d$	$oldsymbol{eta}_{hs}$	CM/dB
1	2/15	15/15	64	2/15	4/15	0.0
2	12/15	15/15	64	12/15	24/25	1.0
3	15/15	8/15	64	15/8	30/15	1.5
4	15/15	4/15	64	15/4	30/15	1.5

#### For Release 5 HSDPA Data Devices:

#### For Release 6 HSPA Data Devices

Sub- test	$eta_{_c}$	$eta_{d}$	β <sub>d</sub> (SF)	$oldsymbol{eta}_{c}$ / $oldsymbol{eta}_{d}$	$eta_{\scriptscriptstyle hs}$	$eta_{\scriptscriptstyle ec}$	$oldsymbol{eta}_{\scriptscriptstyle ed}$	$eta_{ed}$	$eta_{ed}$	CM (dB)	MPR (dB)	AG Index	E- TFCI

3	15/15	9/15	64	15/9	30/15	30/15	$egin{aligned} η_{ed1}{}_{:47/15} \ η_{ed2}{}_{:47/15} \end{aligned}$	4	2	1.5	1.5	15	92
4	2/15	15/15	64	2/15	4/15	4/15	56/75	4	1	1.5	1.5	17	71
5	15/15	15/15	64	15/15	24/15	30/15	134/15	4	1	1.5	1.5	21	81

#### Rel.8 DC-HSDPA (Cat 24)

SAR test exclusion for Rel.8 DC-HSDPA must satisfy the SAR test exclusion requirements of Rel.5 HSDPA. SAR test exclusion for DC-HSDPA devices is determined by power measurements according to the H-Set 12, Fixed Reference Channel (FRC) configuration in Table C.8.1.12 of 3GPP TS 34.121-1. A primary and a secondary serving HS-DSCH Cell are required to perform the power measurement and for the results to qualify for SAR test exclusion.

#### 9.4 SAR Measurement for LTE

SAR tests for LTE are performed with a base station simulator, Rohde & Rchwarz CMW500. Closed loop power control was used so the UE transmits with maximum output power during SAR testing. All powers were measured with the CMW 500.

It is performed for conducted power and SAR based on the KDB941225 D05.

SAR is evaluated separately according to the following procedures for the different test positions in each exposure condition – head, body, body-worn accessories and other use conditions. The procedures in the following subsections are applied separately to test each LTE frequency band.

1) QPSK with 1 RB allocation

Start with the largest channel bandwidth and measure SAR for QPSK with 1 RB allocation, using the RB offset and required test channel combination with the highest maximum output power among RB offsets at the upper edge, middle and lower edge of each required test channel. When the reported SAR is  $\leq 0.8$  W/kg, testing of the remaining RB offset configurations and required test channels is not required for 1 RB allocation; otherwise, SAR is required for the remaining required test channels and only for the RB offset configuration with the highest output power for that channel. When the reported SAR of a required test channel is > 1.45 W/kg, SAR is required for all three RB offset configurations for that required test channel.

2) QPSK with 50% RB allocation The procedures required for 1 RB allocation in 1) are an

The procedures required for 1 RB allocation in 1) are applied to measure the SAR for QPSK with 50% RB allocation.

3) QPSK with 100% RB allocation

For QPSK with 100% RB allocation, SAR is not required when the highest maximum output power for 100 % RB allocation is less than the highest maximum output power in 50% and 1 RB allocations and the highest reported SAR for 1 RB and 50% RB allocation in 1) and 2) are  $\leq 0.8$  W/kg. Otherwise, SAR is measured for the highest output power channel; and if the reported SAR is > 1.45 W/kg, the remaining required test channels must also be tested.

#### TDD test:

TDD testing is performed using guidance from FCC KDB 941225 D05 and the SAR test guidance provided in April 2013 TCB works hop notes. TDD is tested at the highest duty factor using UL-DL configuration 0 with special subframe configuration 6 and applying the FDD LTE procedures in KDB 941225 D05. SAR testing is performed using the extended cyclic prefix listed in 3GPP TS 36.211.

	Norma	cyclic prefix in	downlink	Extended cyclic prefix in downlink					
Special cubfrome	DwPTS	Upl	PTS	DwPTS	UpPTS

configuration	Switch-point periodicity	0	1	2	3	4	5	6	7	8	9	
0	5 ms	D	S	U	U	U	D	S	U	U	U	
1	5 ms	D	S	U	U	D	D	S	U	U	D	
2	5 ms	D	S	U	D	D	D	S	U	D	D	
3	10 ms	D	S	U	U	U	D	D	D	D	D	
4	10 ms	D	S	U	U	D	D	D	D	D	D	
5	10 ms		S	U	D	D	D	D	D	D	D	
6	5 ms	D	S	U	U	U	D	S	U	U	D	

Duty factor is calculated by:

Duty factor = uplink frame\*6+UpPTS\*2/one frame length

=  $(30720.T_s * 6+5120.T_s * 2)/307200.T_s$ 

= 0.633

#### 9.5 Bluetooth & Wi-Fi Measurement Procedures for SAR

Normal network operating configurations are not suitable for measuring the SAR of 802.11 transmitters in general. Unpredictable fluctuations in network traffic and antenna diversity conditions can introduce undesirable variations in SAR results. The SAR for these devices should be measured using chipset based test mode software to ensure that the results are consistent and reliable.

Chipset based test mode software is hardware dependent and generally varies among manufacturers. The device operating parameters established in a test mode for SAR measurements must be identical to those programmed in production units, including output power levels, amplifier gain settings and other RF performance tuning parameters. The test frequencies should correspond to actual channel frequencies defined for domestic use. SAR for devices with switched diversity should be measured with only one antenna transmitting at a time during each SAR measurement, according to a fixed modulation and data rate. The same data pattern should be used for all measurements.

#### 9.6 Power Drift

To control the output power stability during the SAR test, DASY5 system calculates the power drift by measuring the E-field at the same location at the beginning and at the end of the measurement for each test position. These drift values can be found in section14 labeled as: (Power Drift [dB]). This ensures that the power drift during one measurement is within 5%.

### 10 Area Scan Based 1-g SAR

#### 10.1 Requirement of KDB

According to the KDB447498 D01, when the implementation is based the specific polynomial fit algorithm as presented at the 29th Bioelectromagnetics Society meeting (2007) and the estimated 1-gSAR is  $\leq$  1.2 W/kg, a zoom scan measurement is not required provided it is also not needed for any other purpose; for example, if the peak SAR location required for simultaneous transmission SAR test exclusion can be determined accurately by the SAR system or manually to discriminate between distinctive peaks and scattered noisy SAR distributions from area scans.

There must not be any warning or alert messages due to various measurement concerns identified by the SAR system; for example, noise in measurements, peaks too close to scan boundary, peaks are too sharp, spatial resolution and uncertainty issues etc. The SAR system verification must also demonstrate that the area scan estimated 1-g SAR is within 3% of the zoom scan 1-g SAR. When all the SAR results for each exposure condition in a frequency band and wireless mode are based on estimated 1-g SAR, the 1-g SAR for the highest SAR configuration must be determined by a zoom scan.

#### **10.2 Fast SAR Algorithms**

The approach is based on the area scan measurement applying a frequency dependent attenuation parameter. This attenuation parameter was empirically determined by analyzing a large number of phones. The MOTOROLA FAST SAR was developed and validated by the MOTOROLA Research Group in Ft. Lauderdale.

In the initial study, an approximation algorithm based on Linear fit was developed. The accuracy of the algorithm has been demonstrated across a broad frequency range (136-2450 MHz)and for both 1- and 10-g averaged SAR using a sample of 264 SAR measurements from 55wireless handsets. For the sample size studied, the root-mean-squared errors of the algorithm mare 1.2% and 5.8% for 1- and 10-g averaged SAR, respectively. The paper describing the algorithm in detail is expected to be published in August 2004 within the Special Issue of Transactions on MTT.

In the second step, the same research group optimized the fitting algorithm to an Polynomial fit whereby the frequency validity was extended to cover the range 30-6000MHz. Details of this study can be found in the BEMS 2007 Proceedings.

Both algorithms are implemented in DASY software.

### **11 Conducted Output Power**

#### 11.1 GSM Measurement result

#### Table 11.1-1: The conducted power measurement results –GSM850

GSM 850	Measured t	imeslot-av	eraged	Tune up	calculation	Source-ba	Source-based time-averag		
Speech (GMSK)	output	power (dB	m)			outpu	Bm)

NOTES:

1) Division Factors

To average the power, the division factor is as follows:

1TX-slot = 1 transmit time slot out of 8 time slots=> conducted power divided by (8/1) => -9.03dB

2TX-slots = 2 transmit time slots out of 8 time slots=> conducted power divided by (8/2) => -6.02dB

3TX-slots = 3 transmit time slots out of 8 time slots=> conducted power divided by (8/3) => -4.26dB

4TX-slots = 4 transmit time slots out of 8 time slots=> conducted power divided by (8/4) => -3.01dB

According to the conducted power as above, the body measurements are performed with 2Txslots for GSM850.

PCS1900	Measured	l timeslot-a	averaged	Tune up	calculation	Source-based time-average

Picture 12.1 Antenna Locations

#### 12.2 SAR Measurement Positions

N/A

### **13 Evaluation of Simultaneous**

#### Position Main antenna BΤ Sum 0.88 **Highest SAR** Left head, 0.02 0.90 value for Head Cheek (GSM850) 1.02 Highest SAR Rear 10mm < 0.01 1.02 value for Body (GSM850)

#### Table 13.1: The sum of SAR values for Main antenna +BT

#### Conclusion:

According to the above tables, the sum of reported SAR values is<1.6W/kg. So the simultaneous transmission SAR with volume scans is not required.

### 14 SAR Test Result

#### Note:

#### KDB 447498 D01 General RF Exposure Guidance:

For WWAN: Reported SAR(W/kg)= Measured SAR(W/kg)\*Tune-up Scaling Factor

For BT/WLAN: Reported SAR(W/kg)= Measured SAR(W/kg)\* Duty Cycle scaling factor \* Tune-up scaling factor

Testing of other required channels within the operating mode of a frequency band is not required when the reported 1-g or 10-g SAR for the mid-band or highest output power channel is:

 $\leq$  0.8 W/kg or 2.0 W/kg, for 1-g or 10-g respectively, when the transmission band is  $\leq$  100 MHz

 $\,\leq\,$  0.6 W/kg or 1.5 W/kg, for 1-g or 10-g respectively, when the transmission band is between 100 MHz and 200 MHz

 $\le\,$  0.4 W/kg or 1.0 W/kg, for 1-g or 10-g respectively, when the transmission band is  $\,\ge\,$  200 MHz KDB 648474 D04 Handset SAR:

With headset attached, when the reported SAR for body-worn accessory, measured without a headset connected to the handset, is > 1.2 W/kg, the highest reported SAR configuration for that wireless mode and frequency band should be repeated for that body-worn accessory with a headset attached to the handset.

### **15 SAR Measurement Variability**

SAR measurement variability must be assessed for each frequency band, which is determined by the SAR probe calibration point and tissue-equivalent medium used for the device measurements. When both head and body tissue-equivalent media are required for SAR measurements in a frequency band, the variability measurement procedures should be applied to the tissue medium with the highest measured SAR, using the highest measured SAR configuration for that tissue-equivalent medium.

The following procedures are applied to determine if repeated measurements are required. 1) Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg; steps2) through 4) do not apply.

2) When the original highest measured SAR is  $\geq$  0.80 W/kg, repeat that measurement once.

3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is  $\geq$  1.45W/kg (~ 10% from the 1-g SAR limit).

4) Perform a third repeated measurement only if the original, first or second repeated measurement is ≥1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20

Freq	uency		Toot	Original	First	The	Second

## ANNEX A Graph Results

 GSM850 Head

 Date: 12/15/2022

 Electronics: DAE4 Sn1331

 Medium: H700-6000M

 Medium parameters used: f = 848.8 MHz; σ = 0.952 S/m; ε<sub>r</sub> = 42.869; ρ = 1000 kg/m<sup>3</sup>

 Ambient Temperature:23.3°C
 Liquid Temperature: 22.5°C

 Communication System: GSM850 2TX 848.8 MHz Duty Cycle: 1:4.00037

 Probe: EX3DV4 - SN7548 ConvF(10.3, 10.3, 10.3)

Area Scan (81x141x1): Interpolated grid: dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 0.956 W/kg

Zoom Scan (8x6x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 9.678 V/m; Power Drift = -0.11 dB Peak SAR (extrapolated) = 1.08 W/kg SAR(1 g) = 0.722 W/kg; SAR(10 g) = 0.487 W/kg Maximum value of SAR (measured) = 0.933 W/kg

#### **GSM850 Body**

Date: 12/15/2022Electronics: DAE4 Sn1331 Medium: H700-6000M Medium parameters used: f = 848.8 MHz;  $\sigma$  = 0.952 S/m;  $\epsilon_r$  = 42.869;  $\rho$  = 1000 kg/m<sup>3</sup> Ambient Temperature: 23.3°C Liquid Temperature: 22.5°C Communication System: GSM850 2TX 848.8 MHz Duty Cycle: 1:4.00037 Probe: EX3DV4 - SN7548 ConvF(10.3, 10.3, 10.3)

Area Scan (81x141x1): Interpolated grid: dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 1.31 W/kg

Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 39.12 V/m; Power Drift = -0.19 dB Peak SAR (extrapolated) = 1.49 W/kg SAR(1 g) = 0.991 W/kg; SAR(10 g) = 0.678 W/kg Maximum value of SAR (measured) = 1.30 W/kg

## GSM1900 Head

Date: 12/16/2022 Electronics: DAE4 Sn1331 Medium: H700-6000M Medium parameters used: f = 1909.8 MHz;  $\sigma$  = 1.385 S/m;  $\epsilon_r$  = 41.218;  $\rho$  = 1000 kg/m<sup>3</sup> Ambient Temperature:23.3°C Liquid Temperature: 22.5°C Communication System: GSM1900 2TX (0) 1909.8 MHz Duty Cycle: 1:4.00037 Probe: EX3DV4 - SN7548 ConvF(7.8, 7.8, 7.8)

**Area Scan (81x141x1):** Interpolated grid: dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 0.712 W/kg

Zoom Scan (7x6x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 3.097 V/m; Power Drift = -0.11dB Peak SAR (extrapolated) = 0.813 W/kg SAR(1 g) = 0.496 W/kg; SAR(10 g) = 0.304 W/kg Maximum value of SAR (measured) = 0.696 W/kg

## **GSM1900 Body**

Date: 12/16/2022 Electronics: DAE4 Sn1331 Medium: H700-6000M Medium parameters used: f = 1880 MHz;  $\sigma = 1.361$  S/m;  $\varepsilon_r = 41.312$ ;  $\rho = 1000$  kg/m<sup>3</sup> Ambient Temperature:23.3°C Liquid Temperature: 22.5°C Communication System: GSM1900 2TX 1880 MHz Duty Cycle: 1:4.00037 Probe: EX3DV4 - SN7548 ConvF(7.8, 7.8, 7.8)

Area Scan (81x141x1): Interpolated grid: dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 1.05 W/kg

Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 13.88 V/m; Power Drift = -0.16 dB Peak SAR (extrapolated) = 1.18 W/kg SAR(1 g) = 0.669 W/kg; SAR(10 g) = 0.395 W/kg Maximum value of SAR (measured) = 0.962 W/kg

**BT Head** Date: 12/17/2022 Electronics: DAE4 Sn1331 Medium: H700-6000M Medium parameters used : f = 2441 MHz;  $\sigma$  = 1.819 S/m; ε<sub>r</sub> = 40.115;  $\rho$  = 1000 kg/m<sup>3</sup> Ambient Temperature:23.3°C Liquid Temperature: 22.5°C Communication System: BT (0) 2441 MHz Duty Cycle: 1:1 Probe: EX3DV4 - SN7548 ConvF(7.32, 7.32, 7.32)

**Area Scan (101x171x1):** Interpolated grid: dx=1.200 mm, dy=1.200 mm Maximum value of SAR (interpolated) = 0.0509 W/kg

Zoom Scan (9x8x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 0 V/m; Power Drift = 0.01 dB Peak SAR (extrapolated) = 0.0380 W/kg SAR(1 g) = 0.014 W/kg; SAR(10 g) = 0.00491 W/kg Maximum value of SAR (measured) = 0.0251 W/kg

## ANNEX B System Verification Results

## 835MHz

Date: 12/15/2022 Electronics: DAE4 Sn1331 Medium: H900 Medium parameters used: f = 835 MHz;  $\sigma = 0.945$  S/m;  $\epsilon r = 42.86$ ;  $\rho = 1000$  kg/m3 Ambient Temperature:23.3oC Liquid Temperature: 22.5oC Communication System: UID 0, CW (0) Frequency: 835 MHz Duty Cycle: 1:1 Probe: EX3DV4 – SN7548 ConvF(10.3, 10.3, 10.3)

Area Scan (51x131x1): Interpolated grid: dx=1.000 mm, dy=1.000 mm Maximum value of SAR (interpolated) = 5.18 W/kg

Date: 12/16/2022 Electronics: DAE4 Sn1331 Medium: H1900 Medium parameters used: f = 1900 MHz;  $\sigma$  = 1.376 S/m;  $\epsilon$ r = 41.25;  $\rho$  = 1000 kg/m3 Ambient Temperature:23.30C Liquid Temperature: 22.50C Communication System: CW Frequency: 1900 MHz Duty Cycle: 1:1 Probe: EX3DV4 – SN7548 ConvF(7.8, 7.8, 7.8)

Area Scan (51x101x1): Interpolated grid: dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 16.7 W/kg

Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 79.12 V/m; Power Drift = 0.13 dB Peak SAR (extrapolated) = 19.3 W/kg SAR(1 g) = 10.08 W/kg; SAR(10 g) = 5.25 W/kg Maximum value of SAR (measured) = 15.5 W/kg

## 2450MHz

Date: 12/17/2022 Electronics: DAE4 Sn1331 Medium: H2450 Medium parameters used: f = 2450 MHz;  $\sigma = 1.823$  S/m;  $\epsilon r = 40.11$ ;  $\rho = 1000$  kg/m3 Ambient Temperature:23.3oC Liquid Temperature: 22.5oC Communication System: CW Frequency: 2450 MHz Duty Cycle: 1:1 Probe: EX3DV4 – SN7548 ConvF(7.32, 7.32, 7.32)

Area Scan (61x121x1): Interpolated grid: dx=1.200 mm, dy=1.200 mm Maximum value of SAR (interpolated) = 24.6 W/kg

Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 99.59 V/m; Power Drift = -0.18 dB Peak SAR (extrapolated) = 29.4 W/kg SAR(1 g) = 13.65 W/kg; SAR(10 g) = 6.38 W/kg Maximum value of SAR (measured) = 23.4 W/kg

## ANNEX C SAR Measurement Setup

## C.1 Measurement Set-up

The Dasy5 or DASY6 system for performing compliance tests is illustrated above graphically. This system consists of the following items:

Picture C.1SAR Lab Test Measurement Set-up

- A standard high precision 6-axis robot (StäubliTX=RX family) with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running WinXP and the DASY5 or DASY6 software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as
- warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

## C.2 Dasy5 E-field Probe System

The SAR measurements were conducted with the dosimetric probe designed in the classical triangular configuration and optimized for dosimetric evaluation. The probe is constructed using the thick film technique; with printed resistive lines on ceramic substrates. The probe is equipped with an optical multifiber line ending at the front of the probe tip. It is connected to the EOC box on the robot arm and provides an automatic detection of the phantom surface. Half of the fibers are connected to a pulsed infrared transmitter, the other half to a synchronized receiver. As the probe approaches the surface, the reflection from the surface produces a coupling from the transmitting to the receiving fibers. This reflection increases first during the approach, reaches maximum and then decreases. If the probe is flatly touching the surface, the coupling is zero. The distance of the coupling maximum to the surface is independent of the surface reflectivity and largely independent of the surface to probe angle. The DASY5 or DASY6 software reads the reflection durning a software approach and looks for the maximum using 2<sup>nd</sup> ord curve fitting. The approach is stopped at reaching the maximum.

#### **Probe Specifications:**

Model:	ES3DV3, EX3DV4
Frequency	10MHz — 6.0GHz(EX3DV4)
Range:	10MHz — 4GHz(ES3DV3)
Calibration:	In head and body simulating tissue at
	Frequencies from 835 up to 5800MHz
Linearity:	± 0.2 dB(30 MHz to 6 GHz) for EX3DV4
± 0.2 dB(30 MHz	to 4 GHz) for ES3DV3
DynamicRange:	10 mW/kg — 100W/kg
Probe Length:	330 mm
Probe Tip	
Length:	20 mm
<b>Body Diameter:</b>	12 mm
Tip Diameter:	2.5 mm (3.9 mm for ES3DV3)
Tip-Center:	1 mm (2.0mm for ES3DV3)
Application:SAF	R Dosimetry Testing
	Compliance tests ofmobile phones
	Dosimetry in strong gradient fields
Picture C.3E-fiel	d Probe

Picture C.2Near-field Probe

## C.3 E-field Probe Calibration

Each E-Probe/Probe Amplifier combination has unique calibration parameters. A TEM cell calibration procedure is conducted to determine the proper amplifier settings to enter in the probe parameters. The amplifier settings are determined for a given frequency by subjecting the probe to a known E-field density (1 mW/cm<sup>2</sup>) using an RF Signal generator, TEM cell, and RF Power Meter.

The free space E-field from amplified probe outputs is determined in a test chamber. This calibration can be performed in a TEM cell if the frequency is below 1 GHz and inn a waveguide or

No.122Z62236-SEM03

other methodologies above 1 GHz for free space. For the free space calibration, the probe is placed in the volumetric center of the cavity and at the proper orientation with the field. The probe is then rotated 360 degrees until the three channels show the maximum reading. The power density readings equates to 1 mW/cm<sup>2</sup>.

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulated brain tissue. The E-field in the medium correlates with the temperature rise in the dielectric medium. For temperature correlation calibration a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe.

$$SAR = C \frac{\Delta T}{\Delta t}$$

Where:

 $\Delta t$  = Exposure time (30 seconds), C = Heat capacity of tissue (brain or muscle),

 $\Delta T$  = Temperature increase due to RF exposure.

$$SAR = \frac{\left|E\right|^2 \cdot \sigma}{\rho}$$

Where:

 $\sigma$  = Simulated tissue conductivity,

 $\rho$  = Tissue density (kg/m<sup>3</sup>).

## C.4 Other Test Equipment

## C.4.1 Data Acquisition Electronics(DAE)

The data acquisition electronics consist of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder with a control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information, as well as an optical uplink for commands and the clock.

The mechanical probe mounting device includes two different sensor systems for frontal and sideways probe contacts. They are used for mechanical surface detection and probe collision detection.

The input impedance of the DAE is 200 MOhm; the inputs are symmetrical and floating. Common mode rejection is above 80 dB.

PictureC.4: DAE

## C.4.2 Robot

- The SPEAG DASY system uses the high precision robots (DASY5: RX160L) type from Stäubli SA (France). For the 6-axis controller system, the robot controller version from Stäubli is used. The Stäubli robot series have many features that are important for our application:
- High precision (repeatability 0.02mm)
- High reliability (industrial design)
- > Low maintenance costs (virtually maintenance free due to direct drive gears; no belt drives)
- > Jerk-free straight movements (brushless synchron motors; no stepper motors)
- Low ELF interference (motor control fields shielded via the closed metallic construction shields)

Picture C.5 DASY 5

## C.4.3 Measurement Server

The Measurement server is based on a PC/104 CPU broad with CPU (DASY5: 400 MHz, Intel Celeron), chipdisk (DASY5: 128MB), RAM DASY5: 128MB). The necessary circuits for communication with the DAE electronic box, as well as the 16 bit AD converter system for optical detection and digital I/O interface are contained on the DASY I/O broad, which is directly connected to the PC/104 bus of the CPU broad.

The measurement server performs all real-time data evaluation of field measurements and surface detection, controls robot movements and handles safety operation. The PC operating system cannot interfere with these time critical processes. All connections are supervised by a watchdog, and disconnection of any of the cables to the measurement server will automatically disarm the robot and disable all program-controlled robot movements. Furthermore, the measurement server is equipped with an expansion port which is reserved for future applications. Please note that this expansion port does not have a standardized pinout, and therefore only devices provided by SPEAG can be connected. Devices from any other supplier could seriously damage the measurement server.

Picture C.6 Server for DASY 5

## C.4.4 Device Holder for Phantom

The SAR in the phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source at 5mm distance, a positioning uncertainty of  $\pm 0.5$ mm would produce a SAR uncertainty of  $\pm 20\%$ . Accurate device positioning is therefore crucial for accurate and repeatable measurements. The positions in which the devices must be measured are defined by the standards.

The DASY device holder is designed to cope with the different positions given in the standard. It has two scales for device rotation (with respect to the body axis) and device inclination (with respect to the line between the ear reference points). The rotation centers for both scales are the ear reference point (ERP). Thus the device needs no repositioning when changing the angles. The DASY device holder is constructed of low-loss POM material having the following dielectric parameters: relative permittivity  $\ell = 3$  and loss tangent  $\delta = 0.02$ . The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

<Laptop Extension Kit>

The extension is lightweight and made of POM, acrylic glass and foam. It fits easily on the upper part of the Mounting Device in place of the phone positioner. The extension is fully compatible with the Twin-SAM and ELI phantoms.

Picture C7-1: Device Holder

Picture C.7-2: Laptop Extension Kit

## C.4.5 Phantom

The SAM Twin Phantom V4.0 is constructed of a fiberglass shell integrated in a table. The shape of the shell is based on data from an anatomical study designed to

Represent the 90<sup>th</sup> percentile of the population. The phantom enables the dissymmetric evaluation of SAR for both left and right handed handset usage, as well as body-worn usage using the flat phantom region. Reference markings on the Phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot. The shell phantom has a 2mm shell thickness (except the ear region where shell thickness increases to 6 mm).

Shell Thickness:	2±0. 2 mm
Filling Volume:	Approx. 25 liters
Dimensions:	810 x l000 x 500 mm (H x L x W)
Available:	Special

Picture C.8: SAM Twin Phantom

## ANNEX D Position of the wireless device in relation to the phantom

## **D.1 General considerations**

This standard specifies two handset test positions against the head phantom – the "cheek" position and the "tilt" position.

Picture D.1-a Typical "fixed" case handset Picture D.1-b Typical "clam-shell" case handset

Picture D.2 Cheek position of the wireless device on the left side of SAM

Picture D.3 Tilt position of the wireless device on the left side of SAM

## D.2 Body-worn device

A typical example of a body-worn device is a mobile phone, wireless enabled PDA or other battery operated wireless device with the ability to transmit while mounted on a person's body using a carry accessory approved by the wireless device manufacturer.

Picture D.4Test positions for body-worn devices

## D.3 Desktop device

A typical example of a desktop device is a wireless enabled desktop computer placed on a table or desk when used.

The DUT shall be positioned at the distance and in the orientation to the phantom that corresponds to the intended use as specified by the manufacturer in the user instructions. For devices that employ an external antenna with variable positions, tests shall be performed for all antenna positions specified. Picture8.5 show positions for desktop device SAR tests. If the intended use is not specified, the device shall be tested directly against the flat phantom.

Picture D.5 Test positions for desktop devices

## ANNEX E Equivalent Media Recipes

The liquid used for the frequency range of 800-3000 MHz consisted of water, sugar, salt, preventol, glycol monobutyl and Cellulose. The liquid has been previously proven to be suited for worst-case. The Table E.1 shows the detail solution. It's satisfying the latest tissue dielectric parameters requirements proposed by the IEEE 1528 and IEC 62209.

	TUDICET	Composit		110000	Equivale	in matter

## TableE.1: Composition of the Tissue Equivalent Matter

Note: There are a little adjustment respectively for 750, 1750, 2600, 5200, 5300 and 5600 based on the recipe of closest frequency in table E.1.

## ANNEX F System Validation

The SAR system must be validated against its performance specifications before it is deployed.

When SAR probes, system components or software are changed, upgraded or recalibrated, these must be validated with the SAR system(s) that operates with such components.

Liquid name	Validation date	Frequency point	Status (OK or Not)
Head 750MHz	August.2,2022	750 MHz	OK

		equirements for 100 MHz to 6 GHz"
	ed and Interpretation	
<ul> <li>NORMx, y, z:</li> </ul>	Assessed for E-field p	olarization θ=0 (f≤900MHz in TEM-cell; f>1800MHz: waveguide
NORMx,y,z	are only intermediate v	alues, i.e., the uncertainties of NORMx,y,z does not effect the
$E^2$ -field und	ertainty inside TSL (se	e below ConvF).
		ency_response (see Frequency Response Chart). This
		SY4 software versions later than 4.2. The uncertainty of the
		the stated uncertainty of ConvF.
		rization parameters assessed based on the data of power sweet
		es not depend on frequency nor media.
		Ratio that is not calibrated but determined based on the signal
characteristi		valio that is not calibrated but determined based on the signal
		are numerical linearization parameters assessed based on the
		odulation signal. The parameters do not depend on frequency n
		tion range expressed in RMS voltage across the diode.
		neters: Assessed in flat phantom using E-field (or Temperature
Transfer Sta	ndard for f≤800MHz) a	nd inside waveguide using analytical field distributions based of
		Iz. The same setups are used for assessment of the parameter
applied for b	oundary compensation	n (alpha, depth) of which typical uncertainty valued are given.
These paran	neters are used in DAS	SY4 software to improve probe accuracy close to the boundary.
The sensitivi	ty in TSL corresponds	to NORMx,y,z* ConvF whereby the uncertainty corresponds to
that given fo	r ConvF. A frequency of	lependent ConvF is used in DASY version 4.4 and higher which
allows exten	ding the validity from±	50MHz to±100MHz.
<ul> <li>Spherical iso</li> </ul>	stropy (3D deviation fro	om isotropy): in a field of low gradients realized using a flat
phantom exp	bosed by a patch anter	nna.
<ul> <li>Sensor Offset</li> </ul>	et: The sensor offset co	prresponds to the offset of virtual measurement center from the
probe tip (on	probe axis). No tolera	nce required.
<ul> <li>Connector A</li> </ul>	ngle: The angle is asso	essed using the information gained by determining the NORMx
(no uncertair	ty required).

# DASY/EASY – Parameters of Probe: EX3DV4 – SN:7548

## **Basic Calibration Parameters**

	Sensor X	Sensor Y	Sensor Z	Unc ( <i>k</i> =2)
Norm(µV/(V/m) <sup>2</sup> ) <sup>A</sup>	0.62	0.70	0.63	±10.0%
DCP(mV) <sup>B</sup>	101.7	102.0	102.0	

#### **Modulation Calibration Parameters**

UID	Communication		A	В	С	D	VR	Unc <sup>E</sup>
	System Name		dB	dBõV		dB	mV	( <i>k</i> =2)
0	CW	X	0.0	0.0	1.0	0.00	193.2	±2.2%
		Y	0.0	0.0	1.0		208.5	
		Z	0.0	0.0	1.0		192.2	

The reported uncertainty of measurement is stated as the standard uncertainty of Measurement multiplied by the coverage factor k=2, which for a normal distribution Corresponds to a coverage probability of approximately 95%.

<sup>A</sup> The uncertainties of Norm X, Y, Z do not affect the E<sup>2</sup>-field uncertainty inside TSL (see Page 4).

<sup>B</sup> Numerical linearization parameter: uncertainty not required.

<sup>E</sup> Uncertainly is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

4950	36.3	4.40	5.68	5.68	5.68	0.40	1.40	±13.3%
5250	35.9	4.71	4.98	4.98	4.98	0.45	1.35	±13.3%
5600	35.5	5.07	4.57	4.57	4.57	0.45	1.40	±13.3%
5750	35.4	5.22	4.64	4.64	4.64	0.40	1.60	±13.3%

<sup>c</sup> Frequency validity above 300 MHz of ±100MHz only applies for DASY v4.4 and higher (Page 2), else it is restricted to ±50MHz. The uncertainty is the RSS of ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 110 MHz.

<sup>F</sup> At frequency below 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) can be relaxed to ±10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) is restricted to ±5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters. <sup>G</sup> Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for the frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

#### Calibration Laboratory of Schmid & Partner

Engineering AG Zeughausstrasse 43, 8004 Zurich, Switzerland

S Schweizerischer Kalibrierdienst

C Service suisse d'étalonnage Servizio svizzero di taratura

S Swiss Calibration Service

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

#### Glossary:

TSL	tissue simulating liquid
ConvF	sensitivity in TSL / NORM x,y,z
N/A	not applicable or not measured

#### Calibration is Performed According to the Following Standards:

- a) IEC/IEEE 62209-1528, "Measurement Procedure For The Assessment Of Specific Absorption Rate Of Human Exposure To Radio Frequency Fields From Hand-Held And Body-Worn Wireless Communication Devices - Part 1528: Human Models, Instrumentation And Procedures (Frequency Range of 4 MHz to 10 GHz)", October 2020.
- b) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Additional Documentation:

c) DASY System Handbook

#### Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end
  of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The source is mounted in a touch configuration below the center marking of the flat phantom.
- Return Loss: This parameter is measured with the source positioned under the liquid filled phantom (as described in the measurement condition clause). The Return Loss ensures low reflected power. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Certificate No: D835V2-4d069\_Jul22
