3.5. General Description

The Equipment Under Test (EUT) is a model of LINKHUB with internal antenna.

It supports GSM 900/1800/1900MHz, LTE Bands 5/41.

It has Wi-Fi and Wired network functions.

It consists of normal options: Adapter.

Manual and specifications of the EUT were provided to fulfill the test.

Samples (EUT+AE) undergoing test were selected by the Client. Relevant information is provided by the client.

This report also serves as a record of HH40L2, the table below shows the differences;

| Model Differences | HH40L2 (Initial) | HH40L2 (Record) | |

ANNEX A: MEASUREMENT RESULTS

A.1 Radiated Emission (§15.109(a)) Reference

E00 B 4 4 5 4 4

FCC: Part 15.109(a)

A.1.1 Method of measurement

The field strength of radiated emissions from the unintentional radiator at a distance of 3 meters or 1 meter is tested. Tested in accordance with the procedures of ANSI C63.4 -2014, section 8.3. The EUT was placed on a non-conductive table. Below 18GHz the measurement antenna was placed at a distance of 3 meters from the EUT. Above 18GHz the measurement antenna was placed at a distance of 1 meters from the EUT. (According to Part 15.31(f)(1), 1m limit is calculated by extrapolation factor of 20 dB/decade) During the tests, the antenna height and the EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. This maximization process was repeated with the EUT positioned in each of its three orthogonal orientations.

A.1.2 EUT Operating Mode:

Wired network function: A laptop is connected to EUT by unshielded Twisted Pair. The EUT allocate an IP address to this laptop, and start a PING program to establish a communication link between EUT and the laptop.

LTE receiver: The EUT is connected to a adapter for charging. The EUT is synchronized to System Simulator (SS), and able to respond to paging messages and incoming call. An established call has been released.

This device contains the receivers which tune and operate between 30MHz-960MHz in the following bands:LTE Band 5.

The EUT was tested while operating in licensed band receiver mode. All licensed band receivers that tune in the range of 30MHz-960MHz, as listed in Section 3.1, are investigated. Only the worst case emissions are reported.

All equipment is placed on the test table top and arranged in a typical configuration in accordance with ANSI C63.4-2014 and manipulated to obtain worst case emissions. For radiated measurement, pre-scanned in three orthogonal panels, X, Y, Z. The worst cases (Y plane) were recorded in this report.

A.1.3 Measurement Limit

Limit from Part 15.109(a)

^{*}Note: The original limit is defined at 10m test distance. This limit is calculated according to CISPR requirements.

1GHz-40GHz

A.1.6 Measurement Results

A "reference path loss" is established and the A_{Rpl} is the attenuation of "reference path loss". It includes the antenna factor of receive antenna and the path loss.

The measurement results are obtained as described below:

Result= $P_{Mea}+A_{Rpl}=P_{Mea}+G_A+G_{PL}$

Where

GA: Antenna factor of receive antenna

G_{PL}:PathLoss

P_{Mea}: Measurement result on receiver.

Result:Quasi-Peak($dB\mu V/m$)/Average($dB\mu V/m$)/Peak($dB\mu V/m$)

A.2 Conducted Emission (§15.107(a))

Reference

FCC: Part 15.107(a)

A.2.1 Method of measurement

For equipment that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150kHz to 30MHz shall not exceed the limits. Tested in accordance with the procedures of ANSI C63.4 -2014, section 7.3.

A.2.2 EUT Operating Mode:

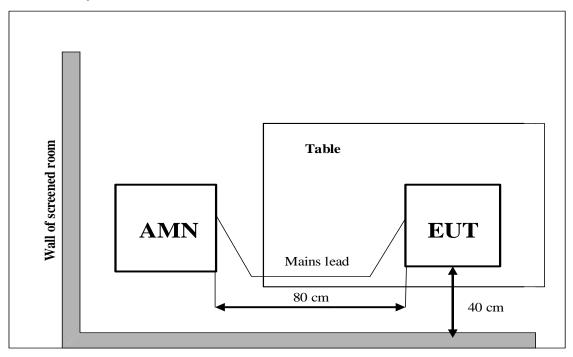

Wired network function: A laptop is connected to EUT by unshielded Twisted Pair. The EUT allocate an IP address to this laptop, and start a PING program to establish a communication link between EUT and the laptop.
