HEARING AID COMPATIBILITY RF EMISSIONS TEST REPORT

FCC ID	:	**2ACCJH183**
Equipment	:	**GSM/UMTS/LTE/NR Mobile phone**
Brand Name	:	**TCL**
Model Name	:	**T803E**
WD Emission Result	:	**PASS**
Applicant	:	**TCL Communication Ltd.** **5/F, Building 22E, 22 Science Park East Avenue, Hong Kong Science Park, Shatin, NT, Hong Kong**
Manufacturer	:	**TCL Communication Ltd.** **5/F, Building 22E, 22 Science Park East Avenue, Hong Kong Science Park, Shatin, NT, Hong Kong**
Standard	:	**FCC 47 CFR §20.19** **ANSI C63.19-2019**
Date Tested	:	**Mar. 27, 2024 ~ Mar. 27, 2024**

We, Sporton International Inc. (Shenzhen), would like to declare that the tested sample provide by manufacturer and the test data has been evaluated in accordance with the test procedures given in ANSI C63.19-2019 / 47 CFR Part 20.19 and has been in compliance with the applicable technical standards.

The test results in this report apply exclusively to the tested model / sample. Without written approval of Sporton International Inc. (Shenzhen), the test report shall not be reproduced except in full.

Type Transport:
VO= Voice only
DT= Digital Transport only (no voice)
VD= CMRS and IP Voice Service over Digital Transport

Remark:
1. The air interface max power plus MIF is complies with ANSI C63.19-2019 Table 4.1 RF$_{AIPL}$
2. Because features of Google Meet allow the option of voice-only communications, Meet has been tested for HAC/T-Coil compatibility to ensure the best user experience.
3. The device has two batteries. For battery 1/2 only suppliers are different, so only battery 1 was chosen to perform full testing.

5. WD Emission Requirements

The WD's conducted power must be at or below either the stated RFAIPL (Table 4.1) or the stated peak power level (Table 4.2), or the average near-field emissions over the measurement area must be at or below the stated RFAIL (Table 4.3), or the stated peak field strength (Table 4.4). The WD may demonstrate compliance by meeting any of these four requirements, but it must do so in each of its operating bands at its established worst-case normal speech-mode operating condition.

Table 4.1 - Wireless device RF audio interference power level	
Frequency range (MHz)	RF_{AIPL} (dBm)
< 960	29

6. *System Description and Operation*

<System Components>
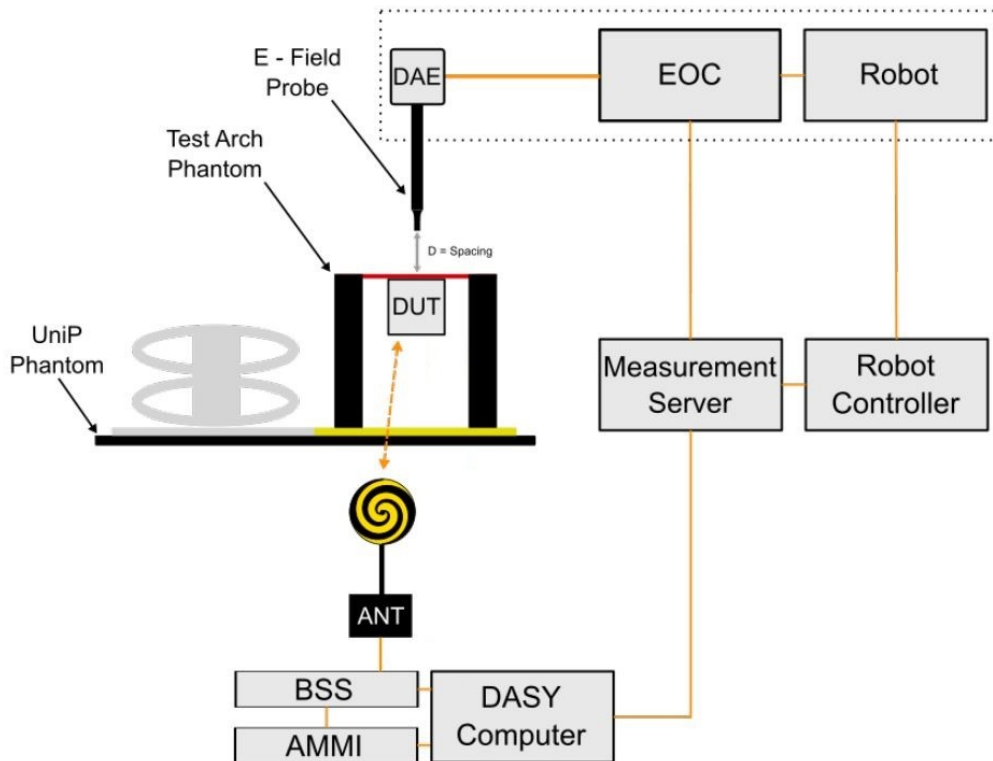

Remark:

A typical al DASY system for HAC measurements consists of

• 6-axis robotic arm (Staubli TX2-60L/ TX2-90XL) for positioning the probe

• Mounting Platform for keeping the phantoms at a field location relative to the robot

• Measurement Server for handling all time-critical tasks, such as measurement data acquisition and supervision of safety features

• EOC (Electrical to Optical Converter) for converting the optical signal from the Data Acquisition Electronics (DAE) to electrical before being transmitted to the measurement server

• LB (Light Beam unit) for probe alignment (measurement of the exact probe length and eccentricity)

• Test Arch for Device Under Test (DUT) testing

• DAE that reads the probe voltages and transmits them to the DASY PC. It is also used to detect probe touch and collision signals

• Device Holder for positioning the DUT beneath the phantom

• ANT (wideband Antenna) for broadcasting the downlink signals emitted by base station simulators (BSS) to the WD

• Operator PC for running the DASY software to define/execute the measurements.

The following components are needed for RFail measurements only:

• Modulation Interference Factor (MIF)

• Isotropic E-field, free-space probe (e.g., EF3DVx)

• Radiofrequency (RF) emission calibration dipoles for system check / validation purposes.

<EF3DV3 E-Field Probe Specification>

Construction	One dipole parallel, two dipoles normal to probe axis Interleaved sensors Built-in shielding against static charges PEEK enclosure material
Calibration	In air from 30 MHz to 6.0 GHz (absolute accuracy ±5.1%, k=2)
Frequency	30 MHz – 6 GHz Linearity: ±0.2 dB (100 MHz – 3 GHz)
Directivity	± 0.2 dB in air (rotation around probe axis) ± 0.4 dB in air (rotation normal to probe axis)
Dynamic Range	2 – >1000 V/m
Linearity	± 0.2 dB
Dimensions	Overall length: 337 mm (tip: 20 mm) Tip diameter: 3.9 mm (body: 12 mm) Distance from probe tip to dipole centers: 1.5 mm Sensor displacement to probe's calibration point: <0.7 mm

Voltage to E-field Conversion

The measured voltage is first linearized to a quantity proportional to the square of the E-field using the (a, b, c, d) set of parameters specific to the communication system and sensor :

$$V_{compi} = U_i + U_i^2 \cdot \frac{10^{\frac{d}{10}}}{dcp_i}$$

where V_{compi} = compensated signal of channel i (µV) (i = x, y, z)
           U_i = input signal of channel i (µV) (i = x, y, z)
           d = PMR factor d (dB) (Probe parameter)
           dcp_i = diode compression point of channel i (µV) (Probe parameter, i = x, y, z)

$$V_{compi\,dB\sqrt{µV}} = 10 + \log_{10}(V_{compi})$$

$$corr_i = a_i \cdot e - \left(\frac{V_{compi\,dB\sqrt{µV}} - b_i}{C_i}\right)^2$$

where $coor_i$ = correction factor of channel i (dB) (i = x, y, z)
           $V_{compi\,dB\sqrt{µV}}$ = compensated voltage of channel i (dB√µV) (i = x, y, z)
           a_i = PMR factor a of channel i (dB) (Probe parameter, i = x,y,z)
           b_i = PMR factor b of channel i (dB√µV) (Probe parameter, i = x,y,z)
           c_i = PMR factor c of channel i (Probe parameter, i = x,y,z)

The voltage $V_{idB\sqrt{µV}}$ is the linearized voltage in dB√µV :

$$V_{i\,dB\sqrt{µV}} = V_{compi\,dB\sqrt{µV}} - corr_i$$

where $V_{i\,dB\sqrt{µV}}$ = linearized voltage of channel i (dB√µV) (i = x,y,z)
           $V_{compi\,dB\sqrt{µV}}$ = compensated voltage of channel i (dB√µV) (i = x,y,z)
           $Corr_i$ = correction factor of channel i (dB) (i = x,y,z)

Sporton International Inc. (Shenzhen)   Page : 9 of 23
TEL : +86-755-86379589 / FAX : +86-755-86379595   Issued Date : Apr. 07, 2024
Form version: 231017

Finally, the linearized voltage is converted in µV :

$$V_i = 10^{\frac{V_{i\,dB_{\sqrt{\mu V}}}}{10}}$$

where V_i = linearized voltage of channel i (µV) (i = x,y,z)
$V_{i\,dB}\sqrt{}_{\mu V}$ = linearized voltage of channel i (dB√µV (i = x,y,z)

The E-field data for each channel are calculated using the linearized voltage :

$$\text{E-field Probes :} \quad E_i = \sqrt{\frac{V_i}{Norm_i \cdot ConvF}}$$

where V_i = compensated signal of channel i, (i = x, y, z)
$Norm_i$ = sensor sensitivity (µV/(V/m)^2 of channel i (i = x, y, z)
ConvF = sensitivity enhancement in solution
E_i = electric field strength of channel i in V/m

The RMS value of the field components gives the total field strength (Hermitian magnitude) :

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

Averaged E-field Calculation

The averaged E-field is defined by

$$E_{avg} = \frac{1}{n} \cdot \sum_{i=1}^{n} E_i$$

where   n = = the number of measurement grid point
E_i = the E-field measured at point i

RFail Calculation

The RFail is finally computed with

$$RFail[dB(V/m)] = 20 \cdot \log_{10}(E_{avg}) + MIF$$

where   RFail = the Radio Frequency Audio Interference Level in dB(V/m)
E_{avg} = the averaged E-field in (V/m) calculated
MIF = the Modulation Interference Factor in dB.

7. *RF Emissions Test Procedure*

Test Instructions

➢ Confirm proper operation of probes and instrumentation
➢ Position WD
➢ Configure WD TX operation

Per 4.5.3.2.2 steps a) to c)

➢ Initialize field probe
➢ Scan Area

Per 4.5.3.2.2 steps d) to f)

➢ Calculate the average of the measured field strength quantity (R_{FAIL}, rms average, or peak)
➢ **Direct method:** Record the average RF Audio Interference Level over the scan grid, in dB(V/m)
➢ **Indirect method:** Add the MIF to the average rms field strength in dB(V/m) over scan grid and record the RF Audio Interference Level, in dB(V/m)
➢ **Peak method:** Record the average peak field strength over the scan grid, in dB(V/m)

Per 4.5.3.2.2 steps g) to i)
4.5.3.2.3 & 4.5.3.2.4

➢ Determine compliance

Per 4.7

Figure of WD near-field emission scan flowchart according to ANSI C63.19:2019

The references and reference plane that shall be used in the WD emissions measurement

Device Under Test Positioning under the Test Arch

Test procedure: Indirect measurement—preferred

a. The measurement procedure using a probe and instrumentation chain with a response of <10 kHz (see ANSI C63.19-2019 section4.5.1) is identical to the direct measurement method of ANSI C63.19-2019 section4.5.3.2.2: however, because of the bandwidth limitations, it cannot include the direct use of the spectral and temporal weighting functions. The output of such measurement systems must be readings of steady state rms field strength in dB(V/m).

b. The RF audio interference level in dB(V/m) is obtained by adding the Modulation Interference Factor (in decibels) to the average steady state rms field strength reading over the measurement area, in dB(V/m), from Step c). Use this result to determine the WD's compliance per ANSI C63.19-2019 section4.7.

c. Scan the entire 50 mm by 50 mm measurement area in equally spaced step sizes and record the reading at each measurement point. The step size shall meet the specification for step size in ANSI C63.19:2019 section 4.5.3.

d. Calculate the average of the measurements taken in Step c

e. Convert the average value found in Step d) to RF audio interference level, in volts per meter, by taking the square root of the reading and then dividing it by the measurement system transfer function, as established in ANSI C63.19:2019 section4.5.3.2.1 pre-test procedure. Convert the result to dB(V/m) by taking the base-10 logarithm and multiplying it by 20. Expressed as a formula

   RF audio interference level in db(V/M) $20 * \log(R_{ave}^{1/2} / TF)$
   where
   R_{ave} is the average reading

f. Compare this RF audio interference level to the limits in ANSI C63.19:2019 section4.7 and record the result

g. Per ANSI C63.19-2019 section4.6, WDs capable of operating multiple transmitters shall be subject to emissions requirements for all such transmitters expected to be operated when the WD is in voice mode operation positioned at a user's ear. Each qualified transmitter is tested individually using the method of Clause 4. Other WD transmitters shall be temporarily disabled or reduced in power level such that their average antenna input power is at least 6 dB lower than the average antenna input power of the transmitter under test. The transmitter under test is set to the fixed and repeatable combination of power and modulation characteristic that is representative of the worst case (highest interference potential) likely to be encountered while the WD is experiencing normal voice mode operation. The limiting measurement for device qualification is the highest RF audio interference potential measured for any of the WD transmitters. If the highest interference measurement is from a transmitter that is not required for normal voice mode operation, a secondary rating may be given that applies when that transmitter is disabled

8. Test Equipment List

Manufacturer	Name of Equipment	Type/Model	Serial Number	Calibration	
				Last Cal.	Due Date
SPEAG	835MHz Calibration Dipole	CD835V3	1182	2022/4/20	2025/4/19

Anymetre	Thermo-Hygrometer	JR593	2020062101	2023/7/8	2024/7/7

Note:
1. NCR: "No-Calibration Required"
2. The dipole calibration interval can be extended to 3 years with justification. The dipoles are also not physically damaged, or repaired during the interval. The justification data in appendix C can be found which the return loss is < -20dB, within 20% of prior calibration, the impedance is within 5 ohm of prior calibration for each dipole.

9. *System Validation*

Obtaining accurate measurements and relevant quantities in Module HAC depends on the proper functioning of many components and the correct parameter settings. Faulty results due to drift, failures, or incorrect parameters might not be recognized, as the differences might not be obvious in the measurements.

SPEAG DASY incorporates a system check, also called system verification procedure, to test for the proper functioning of the system based on the tests described in ANSI C63.19-2019: the RF interference potential test setup is verified with RF Emission Calibration Dipoles.

<u>**<Test Setup>**</u>

1. Set the RF signal generator for either CW. Set its output power so the peak power applied to the antenna is equal to that recorded for the real or emulated signal using the WD modulation format
2. Average input power P = 100 mW (20 dBm) after adjustment for return loss. An input power that generates field levels similar to those from the WD or other suitable level may also be used
3. The test fixture should meet the two-wavelength separation criterion
4. The probe-to-dipole separation, which is measured from closest surface of the dipole to the center point of the probe sensor element, should be 15 mm
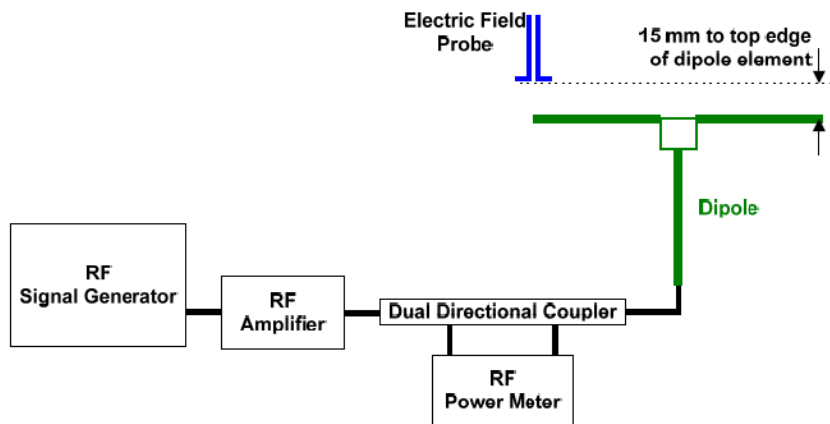

Figure of Setup Diagram

<u>**<Validation Procedure>**</u>

Place a dipole antenna meeting the requirements given in ANSI C63.19: 2019 D.11 in the position normally occupied by the WD. The dipole antenna serves as a known source for an electrical and magnetic output. Position the E-field probe so that:

a. The probe and its cable are parallel to the coaxial feed of the dipole antenna
b. The probe cable and the coaxial feed of the dipole antenna approach the measurement area from opposite directions; and
c. The center point of the probe element(s) is 15 mm from the closest surface of the dipole elements

Scan the length of the dipole with the E-field probe and record the two maximum values found near the dipole ends. Average the two readings and compare the reading to expected value in the calibration certificate or expected value in this standard.

Frequency (MHz)	Input Power (dBm)	Target Value (V/m)	Emax (V/m)	Deviation (%)	Date	Dipole S/N	Probe S/N	DAE S/N
835	20	109.9	106	-3.55	Mar. 27, 2024	1182	4053	1664
1880	20	86.6	84.9	-1.96	Mar. 27, 2024	1168	4053	1664

10. *Modulation Interference Factor*

For any specific fixed and repeatable modulated signal, a Modulation Interference Factor (MIF, expressed in decibels) may be developed that relates its interference potential to its steady state rms signal level or average power level. This factor is a function only of the audio frequency amplitude modulation characteristics of the signal and is the same for field strength or conducted power measurements. It is important to emphasize that the MIF is valid only for a specific repeatable audio frequency amplitude modulation characteristic. Any change in modulation characteristic requires determination and application of a new MIF.

MIF may be determined using a radiated RF field, a conducted RF signal, or, in a preliminary stage, a mathematical analysis of a modeled RF signal.

a. Verify the slope accuracy and dynamic range capability over the desired operating frequency band of a fast probe or sensor, square-law detector, as specified in ANSI C63.19: 2019 D.3, and weighting system as specified in ANSI C63.19: 2019 D.4 and ANSI C63.19: 2019 D.5. For the probe and instrumentation included in the measurement of MIF, additional calibration and application of calibration factors are not required.

b. Using RF illumination, or conducted coupling, apply the specific modulated signal in question to the measurement system at a level within its confirmed operating dynamic range

c. Measure the steady-state rms level at the output of the fast probe or sensor

d. Measure the steady-state average level at the weighting output

e. Without changing the square-law detector or weighting system, and using RF illumination, or conducted coupling, substitute for the specific modulated signal a 1 kHz, 80% amplitude modulated carrier at the same frequency and adjust its strength until the level at the weighting output equals the Step d) measurement

f. Without changing the carrier level from Step e), remove the 1 kHz modulation and again measure the steady-state rms level indicated at the output of the fast probe or sensor.

g. The MIF for the specific modulation characteristic is given by the ratio of the Step f) measurement to the Step c) measurement, expressed in decibels (20*log(step6/step3)

In practice, Step e) and Step f) need not be repeated for each MIF determination if the relationship between the two measurements has been pre-established for the measurement system over the operating frequency and dynamic ranges. In such cases, only the modulation characteristic being tested needs to be available during WD testing Since indirect measurement procedure was using for RF audio interference power level evaluation, the MIF values applied in this test report were provided by the HAC equipment provider of SPEAG, and the worst values for all air interface are listed below to be determine the Wireless device RF audio interference power level. For UID 10973 is applicable only when 5GNR TDD PC2 with 50% Duty Cycle, and all other 5GNR modes are applicable with UID 10769 more conservatively.

UID	Communication System Name	MIF(dB)
10021	GSM-FDD(TDMA,GMSK)	3.63
10025	EDGE-FDD (TDMA, 8PSK, TN 0)	3.75
10460	UMTS-FDD(WCDMA, AMR)	-25.43
10225	UMTS-FDD (HSPA+)	-20.39
10170	LTE-FDD(SC-FDMA,1RB,20MHz,16-QAM)	-9.76
10173	LTE-TDD (SC-FDMA, 1 RB, 20 MHz, 16-QAM)	-1.44
10769	5G NR (CP-OFDM, 1 RB, 15 MHz, QPSK, 15 kHz)	-12.08

11. *Evaluation of WD RF interference potential*

General Note:

1. In this report, max conducted power from each air interface was first used to evaluate whether it complies with ANSI C63.19-2019 Table 4.1 RF_{AIPL}, compliance with table 4.1 means compliance with WD emission requirements. the RF_{AIPL} evaluation refer to section 11.1 for detail.
2. If there some air interface were not meet ANSI C63.19-2019 table 4.1 requirement, these air interfaces were further evaluation ANSI C63.19-2019 Table 4.3 RF_{AIL} requirement. And the RF_{AIL} evaluation result refer to section11.2

11.1 Evaluation RF_{AIPL}

<WWAN Max Tune-up Limit>

<Ant0>

Frequency Band		Average Power (dBm)
GSM	GSM850	29.00
	EDGE850	24.00
WCDMA	WCDMA V	23.50
	HSPA	22.00
FDD LTE	LTE Band 5	25.00
	LTE Band 12	25.00
	LTE Band 13	25.00
	LTE Band 17	25.00
	LTE Band 26	25.00
FDD NR	FR1 n5	24.50

<Ant1>

Frequency Band		Average Power (dBm)
FDD LTE	LTE Band 4	20.00
	LTE Band 7	23.50
	LTE Band 66	24.50

<Ant2>

Frequency Band		Average Power (dBm)
GSM	GSM1900	28.00
	EDGE1900	26.80
WCDMA	WCDMA II	19.00
	HSPA	17.50
	WCDMA IV	21.00
	HSPA	18.50
FDD LTE	LTE Band 2	19.50
	LTE Band 4	20.00
	LTE Band 25	19.50
	LTE Band 66	20.00
TDD LTE	LTE Band 42	20.00
	LTE Band 48	20.00
5G NR FDD	FR1 n2	20.50
	FR1 n66	20.50
5G NR TDD	FR1 n77	14.50
	FR1 n78	12.50

<Ant4>

Frequency Band		Average Power (dBm)
FDD LTE	LTE Band 7	15.50
TDD LTE	LTE Band 38	19.50
	LTE Band 41	19.50
FDD NR	n7	24.00

<WLAN Max Tune-up Limit>

<Ant7>

Frequency Band		Average Power (dBm)
2.4GHz WLAN	802.11b	18.50
	802.11g	18.00
	802.11n-HT20	18.00
	802.11n-HT40	17.00
5GHz WLAN	802.11a	16.00
	802.11n-HT20	16.00
	802.11n-HT40	15.00
	802.11ac-VHT20	16.00
	802.11ac-VHT40	15.00
	802.11ac-VHT80	12.00

<Evaluation RF audio interference power level>

General Note:
1. Use maximum power plus worst case MIF to determine whether it complies with RF_{AIPL}
2. If maximum power plus worst case MIF does not complies with RF_{AIPL}, then further evaluation RF_{AIL} include in section 11.2.
3. EDGE data modes is not necessary due the GSM Voice mode is the worst case.
4. According to ANSI C63.19 2019, if maximum power plus worst case MIF is complies with RF_{AIPL}, means compliance with WD emission requirements.

<Ant0>

Frequency Band		Average Power (dBm)	Worst Case MIF (dB)	Power + MIF(dB)	C63.19 Lowest RFAIPL (dBm)	C63.19 test required

12. *Conducted RF Output Power (Unit: dBm)*

<GSM>

Average Antenna Input Power(dBm)						
Band	GSM850			GSM1900		
Channel	128	189	251	512	661	810
Frequency (MHz)	824.2	836.4	848.8	1850.2	1880.0	1909.8
GSM (GMSK, 1 Tx slot)	27.93	28.02	27.90	27.61	27.62	27.59

13. RF_{AIL} Test Results

General Note:
1. The HAC measurement system applies MIF value onto the measured RMS E-field, which is indirect method in ANSI C63.19-2019 version, and reports the RF audio interference level.
2. Phone Condition: Mute on; Backlight off; Max Volume.

Plot No.	Air Interface	Modulation / Mode	Channel	Average Antenna Input Power (dBm)	MIF	RF_{AIL} (dBV/m)
1	GSM850	Voice	128	27.93	3.63	37.90
2	GSM850	Voice	189	28.02	3.63	38.55
3	GSM850	Voice	251	27.90	3.63	37.83
4	GSM1900	Voice	512	27.61	3.63	29.08
5	GSM1900	Voice	661	27.62	3.63	28.51
6	GSM1900	Voice	810	27.59	3.63	28.61

Test Engineer : Hank Huang, Kevin Xu, David Dai, Bin He

14. *Uncertainty Assessment*

The component of uncertainly may generally be categorized according to the methods used to evaluate them. The evaluation of uncertainly by the statistical analysis of a series of observations is termed a Type A evaluation of uncertainty. The evaluation of uncertainty by means other than the statistical analysis of a series of observation is termed a Type B evaluation of uncertainty. Each component of uncertainty, however evaluated, is represented by an estimated standard deviation, termed standard uncertainty, which is determined by the positive square root of the estimated variance.

The combined standard uncertainty of the measurement result represents the estimated standard deviation of the result. It is obtained by combining the individual standard uncertainties of both Type A and Type B evaluation using the usual "root-sum-squares" (RSS) methods of combining standard deviations by taking the positive square root of the estimated variances. Expanded uncertainty is a measure of uncertainty that defines an interval about the measurement result within which the measured value is confidently believed to lie. It is obtained by multiplying the combined standard uncertainty by a coverage factor. For purpose of this document, a coverage factor two is used, which corresponds to confidence interval of about 95 %. The DASY uncertainty Budget is showed below Table.

The judgment of conformity in the report is based on the measurement results excluding the measurement uncertainty.

Error Description	Uncertainty Value (±%)	Probability Distribution	Divisor	Ci (Eav)	Standard Uncertainty (E) (±%)
Measurement System					
Probe Calibration	5.1	Normal	1	1	5.1
Axial Isotropy	4.7	Rectangular	$\sqrt{3}$	1	2.7
Sensor Displacement	7.2	Rectangular	$\sqrt{3}$	0.5	2.1
Boundary Effects	2.4	Rectangular	$\sqrt{3}$	1	1.4
Phantom Boundary Effects	7.2	Rectangular	$\sqrt{3}$	1	4.2
Linearity	4.7	Rectangular	$\sqrt{3}$	1	2.7
Scaling with PMR Calibration	10.0	Rectangular	$\sqrt{3}$	1	5.8
System Detection Limit	1.0	Rectangular	$\sqrt{3}$	1	0.6
Readout Electronics	0.3	Normal	1	1	0.3
Response Time	0.8	Rectangular	$\sqrt{3}$	0	0.0
Integration Time	2.6	Rectangular	$\sqrt{3}$	0	0.0
RF Ambient Conditions	3.0	Rectangular	$\sqrt{3}$	1	1.7
RF Reflections	12.0	Rectangular	$\sqrt{3}$	1	6.9
Probe Positioner	1.2	Rectangular	$\sqrt{3}$	1	0.7
Probe Positioning	3.0	Rectangular	$\sqrt{3}$	1	1.7
Extrap. and Interpolation	1.0	Rectangular	$\sqrt{3}$	1	0.6
Test Sample Related					
Device Positioning Vertical	4.7	Rectangular	$\sqrt{3}$	1	2.7
Device Positioning Lateral	1.0	Rectangular	$\sqrt{3}$	1	0.6
Device Holder and Phantom	2.4	Rectangular	$\sqrt{3}$	1	1.4
Power Drift	5.0	Rectangular	$\sqrt{3}$	1	2.9
Phantom and Setup Related					
Phantom Thickness	2.4	Rectangular	$\sqrt{3}$	1	1.4
Combined Std. Uncertainty					13.1%
Coverage Factor for 95 %					K=2
Expanded STD Uncertainty					26.3%
Declaration of Conformity: The test results with all measurement uncertainty excluded are presented in accordance with the regulation limits or requirements declared by manufacturers.					
Comments and Explanations: The declared of product specification for EUT presented in the report are provided by the manufacturer, and the manufacturer takes all the responsibilities for the accuracy of product specification.
