ANNEX A: MEASUREMENT RESULTS

A.1. Measurement Method

A.1.1. Conducted Measurements

The below figure shows the DFS setup, where the EUT is a WLAN device operating in slave mode, without Radar Interference Detection function. This setup also contains a device operating in master mode. The radar test signals are injected into the master device. The EUT (slave device) is associated with the master device. WLAN traffic is generated by streaming the mpeg file from the master to the slave in full monitor video mode using the media player.

Note:

- 1) All Measurements are performed with the EUT's narrowest channel bandwidth.
- 2) The master device information is as follows
Vendor: Cisco
Model: AIR-AP1252AG-A-K9
FCC ID: LDK102061, 1DK102062
- 3) The software of radar signal generator (R&S SMU200A) is completely designed based on FCC-06-96A1/NTIA requirement.

A.1.2. Parameters of DFS test signal

1). Interference threshold values, master or client incorporation in service monitoring. For device power less than 23dBm (E.I.R.P.), the threshold level is -62 dBm at the antenna port after correction for antenna gain and procedural adjustments.

Because of conducted measurement performed, the calibration power from radar signal generator to antenna port of DFS test equipment is -62 dBm.

| Maximum Transmit Power | Value |
|------------------------|---------|
| > 200 mW | -64 dBm |
| < 200 mW | -62 dBm |

2). DFS requirement values

The required values are as the following table.

| Parameter | Value |
|-----------------------------------|---|
| Non-occupancy | > 1800 s |
| Channel Availability Check Time | 60 s |
| Channel Move Time | 10 s |
| Channel Closing Transmission Time | 200 ms + 60 ms |
| U-NII Detection Bandwidth | Minimum 80% of the 99% transmission power bandwidth |

As the EUT is IP based system, the MPEG video file from NTIA website is used to steam to EUT via the Master device.

A.1.3. Measurement Uncertainty

| Item | Measurement Uncertainty |
|-------|-------------------------|
| Time | 0.70 ms |
| Power | 0.75 dBm |

A.2. Channel move time and channel closing transmission time

Measurement Limit:

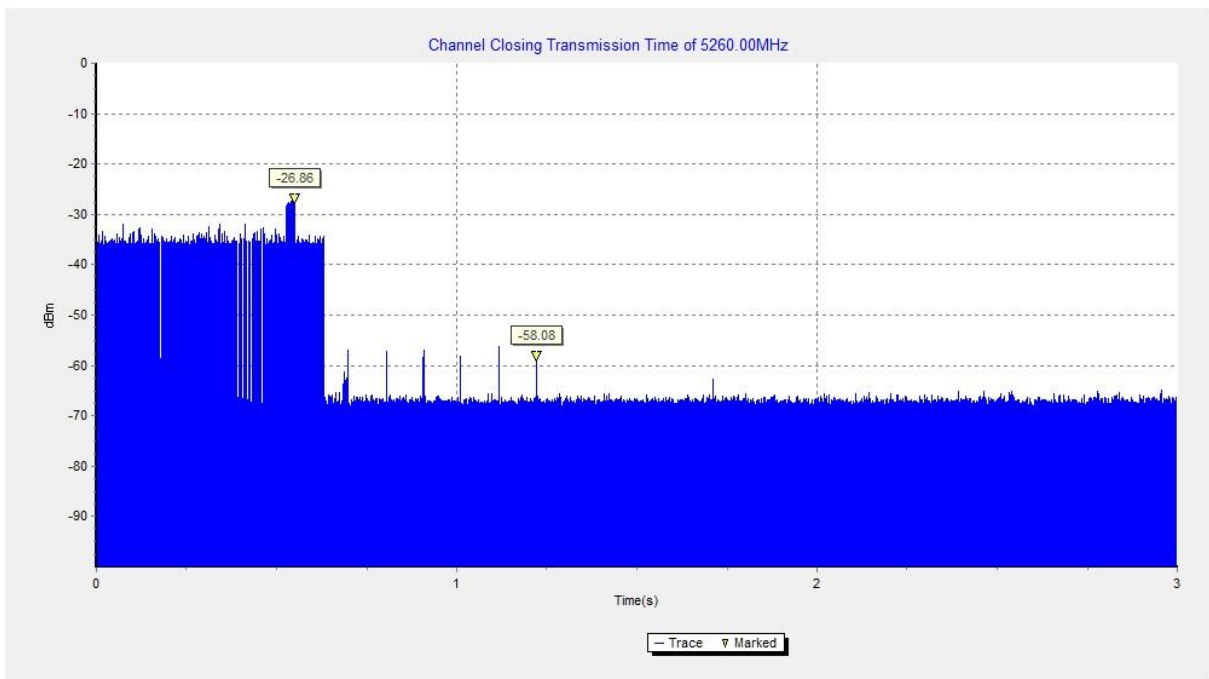

| Test Items | Limit |
|-----------------------------------|------------------|
| channel closing transmission time | < 200 ms + 60 ms |
| Channel move time | < 10 s |

Measurement Results:

HT20 Frequency Band: 5250MHz ~ 5350MHz

The channel move time is as the figure. It shows the time of the radar and the client pulses. The figure shows that the client stops transmission within 10 seconds, and no transmissions occur after 10 seconds later of the radar burst signal.

The closing transmission time is as the figure, and the result is 95.90ms.

Conclusion: PASS

HT80 Frequency Band: 5470MHz ~ 5725MHz

The channel move time is as the figure. It shows the time of the radar and the client pulses. The figure shows that the client stops transmission within 10 seconds, and no transmissions occur after 10 seconds later of the radar burst signal.

The closing transmission time is as the figure, and the result is 68.93ms

Conclusion: PASS

A.3. Non-Occupancy Period

Measurement Limit:

| Test Items | Limit |
|----------------------|----------|
| Non-Occupancy Period | > 1800 s |

A3.1 Associated test

Associate the master and client, transmit specified stream between the master and client; monitor the analyzer on the operating frequency to make sure no beacons have been transmitted for 1800 seconds.

HT20 Frequency Band: 5250MHz ~ 5350MHz

The figure above shows that the client does not transmit any emission within 1800 seconds after getting the order of “stop transmits” from the DFS master (access point).

HT80 Frequency Band: 5470MHz ~ 5725MHz

The figure above shows that the client does not transmit any emission within 1800 seconds after getting the order of “stop transmits” from the DFS master (access point).

Conclusion: PASS
