## ANNEX A: MEASUREMENT RESULTS

### A.1. Measurement Method

#### A.1.1. Conducted Measurements

The below figure shows the DFS setup, where the EUT is a WLAN device operating in slave mode, without Radar Interference Detection function. This setup also contains a device operating in master mode. The radar test signals are injected into the master device. The EUT (slave device) is associated with the master device. WLAN traffic is generated by streaming the mpeg file from the master to the slave in full monitor video mode using the media player.

Note:

- 1) All Measurements are performed with the EUT's narrowest channel bandwidth.
- 2) The master device information is as follows  
Vendor: Ruckus  
Model:R600  
FCC ID: S9GR600
- 3) The software of radar signal generator (R&S SMU200A) is completely designed based on FCC-06-96A1/NTIA requirement.

#### A.1.2. Parameters of DFS test signal

1). Interference threshold values, master or client incorporation in service monitoring. For device power less than 23dBm (E.I.R.P.), the threshold level is -62 dBm at the antenna port after correction for antenna gain and procedural adjustments.

Because of conducted measurement performed, the calibration power from radar signal generator to antenna port of DFS test equipment is -62 dBm.

| Maximum Transmit Power | Value   |
|------------------------|---------|
| > 200 mW               | -64 dBm |
| < 200 mW               | -62 dBm |

The radar Detection Threshold, lowest antenna gain is the parameter of interference radar DFS detection threshold.

One 10 Second plot bee reported for the short Pulse Radar type 1-4, the type 0 was be used, which was selected by auto test software.

### 80M Calibration Result

#### 2). DFS requirement values

The required values are as the following table.

| Parameter                         | Value   |
|-----------------------------------|---|
| Non-occupancy                     | > 1800 s  |
| Channel Availability Check Time   | 60 s  |
| Channel Move Time                 | 10 s  |
| Channel Closing Transmission Time | 200 ms + 60 ms                                      |
| U-NII Detection Bandwidth         | Minimum 80% of the 99% transmission power bandwidth |

As the EUT is IP based system, the MPEG video file from NTIA website is used to steam to EUT via the Master device.

#### A.1.3. Measurement Uncertainty

| Item  | Measurement Uncertainty |
|-------|-------------------------|
| Time  | 0.70 ms                 |
| Power | 0.75 dBm                |

## A.2. Channel move time and channel closing transmission time

### Measurement Limit:

| Test Items                        | Limit            |
|-----------------------------------|------------------|
| channel closing transmission time | < 200 ms + 60 ms |
| Channel move time                 | < 10 s           |

### Measurement Results:

Frequency Band: 5250MHz ~ 5350MHz

Date: 13.JUN.2018 10:32:23

The channel move time is as the figure. It shows the time of the radar and the client pulses. The figure shows that the client stops transmission within 10 seconds, and no transmissions occur after 10 seconds later of the radar burst signal.

**Frequency Band: 5250MHz ~ 5350MHz**

Date: 15.JUN.2018 09:49:52

The closing transmission time is as the figure, and the result is  $(\Delta 2 - \Delta 1) + (\Delta 4 - \Delta 3) * 5 = 115.26 \text{ms}$ .

**Conclusion: PASS**

**Frequency Band 5470MHz ~ 5725MHz**

Date: 14.MAY.2018 16:37:56

The channel move time is as the figure. It shows the time of the radar and the client pulses. The figure shows that the client stops transmission within 10 seconds, and no transmissions occur after 10 seconds later of the radar burst signal.

Frequency Band 5470MHz ~ 5725MHz

Date: 15.MAY.2018 10:59:33

The closing transmission time is as the figure, and the result is  $(\Delta 2-\Delta 1)+(\Delta 4-\Delta 3)*6=149.01\text{ms}$ .

**Conclusion: PASS**

### A.3.Non-Occupancy Period

#### Measurement Limit:

| Test Items           | Limit    |
|----------------------|----------|
| Non-Occupancy Period | > 1800 s |

#### A3.1 Associated test

Associate the master and client, transmit specified stream between the master and client; monitor the analyzer on the operating frequency to make sure no beacons have been transmitted for 1800 seconds.

#### Frequency Band: 5150MHz ~ 5350MHz

Date: 14.MAY.2018 16:31:00

The figure above shows that the client does not transmit any emission within 1800 seconds after getting the order of “stop transmits” from the DFS master (access point).

**Conclusion: PASS**
