## ANNEX A: Detailed Test Results

## A.1. Measurement Method

## A.1.1. Conducted Measurements

The measurement is made according to ANSI C63.10.
1). Connect the EUT to the test system correctly.
2). Set the EUT to the required work mode (Transmitter, receiver or transmitter \& receiver),
3). Set the EUT to the required channel.
4). Set the EUT hopping mode (hopping or hopping off).
5). Set the spectrum analyzer to start measurement.
6). Record the values. Vector Signal Analyzer

## A.1.2. Radiated Emission Measurements

The measurement is made according to ANSI C63.10.
The radiated emission test is performed in semi-anechoic chamber. The distance from the EUT to the reference point of measurement antenna is 3 m . The test is carried out on both vertical and horizontal polarization and only maximization result of both polarizations is kept. During the test, the turntable is rotated $360^{\circ}$ and the measurement antenna is moved from 1 m to 4 m to get the maximization result.
In the case of radiated emission, the used settings are as follows,
Sweep frequency from 30 MHz to 1 GHz , RBW $=100 \mathrm{kHz}, \mathrm{VBW}=300 \mathrm{kHz}$;
Sweep frequency from 1 GHz to 26 GHz, RBW $=1 \mathrm{MHz}, V B W=1 \mathrm{MHz}$;

## A.2. Peak Output Power - Conducted

Method of Measurement: See ANSI C63.10-clause 11.9.1.1
a) Set the RBW $=1 \mathrm{MHz}$.
b) Set VBW $=3 \mathrm{MHz}$.
c) Set span $=3 \mathrm{MHz}$.
d) Sweep time = auto couple.
e) Detector = peak.
f) Trace mode = max hold.
g) Allow trace to fully stabilize.
h) Use peak marker function to determine the peak amplitude level.

## A.3. Frequency Band Edges - Conducted

## Method of Measurement: See ANSI C63.10-clause 6.10.4

Connect the spectrum analyzer to the EUT using an appropriate RF cable connected to the EUT output. Configure the spectrum analyzer settings as described below.
a) Set Span $=8 \mathrm{MHz}$
b) Sweep Time: Auto
c) Set the RBW= 100 kHz
c) Set the VBW $=300 \mathrm{kHz}$
d) Detector: Peak
e) Trace: Max hold

Observe the stored trace and measure the amplitude delta between the peak of the fundamental and the peak of the band-edge emission. This is not an absolute field strength measurement; it is only a relative measurement to determine the amount by which the emission drops at the band edge relative to the highest fundamental emission level.

## Measurement Limit:

## A.4. Transmitter Spurious Emission - Conducted

## Method of Measurement: See ANSI C63.10-clause 11.11.2 and clause 11.11.3 Measurement Procedure - Reference Level

1. Set the RBW $=100 \mathrm{kHz}$.
2. Set the VBW $=300 \mathrm{kHz}$.
3. Set the span to $\geqslant 1.5$ times the DTS bandwidth.
4. Detector = peak.
5. Sweep time = auto couple.
6. Trace mode = max hold.
7. Allow trace to fully stabilize.
8. Use the peak marker function to determine the maximum PSD level. Next, determine the power in 100 kHz band segments outside of the authorized frequency band using the following measurement:

## Measurement Procedure - Unwanted Emissions

1. Set RBW $=100 \mathrm{kHz}$.
2. Set VBW $=300 \mathrm{kHz}$.
3. Set span to encompass the spectrum to be examined.
4. Detector $=$ peak.

6. Sweep = auto couple.
7. Allow the trace to stabilize (this may take some time, depending on the extent of the span).

Ensure that the amplitude of all unwanted emissions outside of the authorized frequency band (excluding restricted frequency bands) is attenuated by at least the minimum requirements specified above.

## Test Condition

The EUT was placed on a non-conductive table. The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and the EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. This maximization process was repeated with the EUT positioned in each of its three orthogonal orientations.

| Frequency of emission <br> $(\mathrm{MHz})$ | $\mathrm{RBW} / \mathrm{VBW}$ | Sweep Time(s) |
| :---: | :---: | :---: |
| $30-1000$ | $100 \mathrm{KHz} / 300 \mathrm{KHz}$ | 5 |
| $1000-4000$ | $1 \mathrm{MHz} / 1 \mathrm{MHz}$ | 15 |
| $4000-18000$ | $1 \mathrm{MHz} / 1 \mathrm{MHz}$ | 40 |
| $18000-26500$ | $1 \mathrm{MHz} / 1 \mathrm{MHz}$ | 20 |

## Measurement Results:

A "reference path loss" is established and the $\mathrm{A}_{\text {Rpl }}$ is the attenuation of "reference path loss", and including the gain of receive antenna, the gain of the preamplifier, the cable loss.
The measurement results are obtained as described below:
Result= $P_{\text {Mea }}+A_{\text {Rpl }}$

## A.6. 6dB Bandwidth

## Method of Measurement:

The measurement is made according to ANSI C63.10 clause 11.8.1

1. Set RBW = 100 kHz .
2. Set the video bandwidth (VBW) $=300 \mathrm{kHz}$.
3. Detector $=$ Peak.
4. Trace mode = max hold.
5. Sweep = auto couple.
6. Allow the trace to stabilize.
7. Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

Measurement Limit:

| Standard | Limit |

2. Set the VBW $=10 \mathrm{kHz}$.
3. Set the span to 2 times the DTS bandwidth.
4. Detector = peak.
5. Sweep time = auto couple.
6. Trace mode = max hold.
7. Allow trace to fully stabilize.

## A.8. AC Powerline Conducted Emission

## Method of Measurement: See ANSI C63.10-clause 6.2

1. the one EUT cable configuration and arrangement and mode of operation that produced the emission with the highest amplitude relative to the limit is selected for the final measurement, while applying the appropriate modulating signal to the EUT.
2. If the EUT is relocated from an exploratory test site to a final test site, the highest emissions shall be remaximized at the final test location before final ac power-line conducted emission measurements are performed.
3. The final test on all current-carrying conductors of all of the power cords to the equipment that comprises the EUT (but not the cords associated with other non-EUT equipment in the system) is then performed for the full frequency range for which the EUT is being tested for compliance without further variation of the EUT arrangement, cable positions, or EUT mode of operation.
4. If the EUT is comprised of equipment units that have their own separate ac power connections, e.g., floor-standing equipment with independent power cords for each shelf that are able to connect directly to the ac power network, each current-carrying conductor of one unit is measured while the other units are connected to a second (or more) LISN(s). All units shall be separately measured. If a power strip is provided by the manufacturer, to supply all of the units making up the EUT, only the conductors in the power cord of the power strip shall be measured.
5. If the EUT uses a detachable antenna, these measurements shall be made with a suitable dummy load connected to the antenna output terminals; otherwise, the tests shall be made with the antenna connected and, if adjustable, fully extended. When measuring the ac conducted emissions from a device that operates between 150 kHz and 30 MHz a non-detachable antenna may be replaced with a dummy load for the measurements within the fundamental emission band of the transmitter, but only for those measurements. 36 Record the six highest EUT emissions relative to the limit of each of the current-carrying conductors of the power cords of the equipment that comprises the EUT over the frequency range specified by the procuring or regulatory agency. Diagram or photograph the test setup that was used. See Clause 8 for full reporting requirements.
