# **3 Equipment Under Test (EUT) and Ancillary Equipment (AE)**

### 3.1 About EUT

Description:	GSM four bands /UMTS three bands /LTE ten bands mobile phone
Model name:	4056L
Operating mode(s):	GSM850/900/1800/1900, WCDMAB2/B4/B5, BT, Wi-Fi, LTE Band 2/4/5/12/13/25/26/41/66/71

### 3.2 Internal Identification of EUT used during the test

EUT ID*	IMEI	HW Version	SW Version
EUT1	01599900000816	03	5G3HU1H0

\*EUT ID: is used to identify the test sample in the lab internally.

**Note:** It is performed to test HAC with the EUT1

### 3.3 Internal Identification of AE used during the test

AE ID*	Description	Model	SN	Manufacturer
AE1	Battery	TLi017C7	/	VEKEN

\*AE ID: is used to identify the test sample in the lab internally.

### 3.4 Air Interfaces / Bands Indicating Operating Modes

Air-interface	Band(MHz)	Туре	C63.19/tested	Simultaneous Transmissio ns	Name of Voice Service
GSM	850	VO	Yes	BT, WLAN	CMRS Voice
GSIVI	1900	vu			
	850				
	1700	VO	NO <sup>(1)</sup>	BT, WLAN	CMRS Voice
(UMTS)	1900				
LTE TDD	Band41	V/D	Yes	BT, WLAN	VoLTE
LTE FDD	Band12/13/25/26/66 /71	V/D	NO <sup>(1)</sup>	BT, WLAN	VoLTE
ВТ	2450	DT	NA	GSM,WCDM A ,LTE	NA
WLAN	2450	DT	NA	GSM,WCDM A ,LTE	NA

NA: Not Applicable VO: Voice Only V/D: CMRS and IP Voice Service over Digital Transport DT: Digital Transport

\* HAC Rating was not based on concurrent voice and data modes, Non current mode was found to represent worst case rating for both M and T rating

Note1= The air interface is exempted from testing by low power exemption that its average antenna input power plus its MIF is  $\leq$ 17 dBm, and is rated as M4.

Note2= The device have similar frequency in some LTE bands: LTEB2/25, 5/26,4/66, since the supported frequency spans for the smaller LTE bands are completely cover by the larger LTE bands, therefore, only larger LTE bands were required to be tested for hearing-aid compliance.

# 4 Maximum Output Power

# **6 OPERATIONAL CONDITIONS DURING TEST**

### 6.1 HAC MEASUREMENT SET-UP

These measurements are performed using the DASY5 NEO automated dosimetric assessment system. It is made by Schmid & Partner Engineering AG (SPEAG) in Zurich, Switzerland. It consists of high precision robotics system (Stäubli), robot controller, Intel Core2 computer, near-field probe, probe alignment sensor. The robot is a six-axis industrial robot performing precise movements. A cell controller system contains the power supply, robot controller, teach pendant (Joystick), and remote control, is used to drive the robot motors. The PC consists of the HP Intel Core21.86 GHz computer with Windows XP system and HAC Measurement Software DASY5 NEO, A/D interface card, monitor, mouse, and keyboard. The Stäubli Robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE)circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical into digital electric signal of the DAE and transfers data to the PC plug-in card.

The DAE4 consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the PC-card is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe mounting device includes two different sensor systems for frontal and sidewise probe contacts. They are also used for mechanical surface detection and probe collision detection. The robot uses its own controller with a built in VME-bus computer.

### 6.2 Probe Specification

### E-Field Probe Description

One dipole parallel, two dipoles normal to probe axis	
Built-in shielding against static charges	
PEEK enclosure material	E
In air from 100 MHz to 3.0 GHz (absolute accuracy ±6.0%, k=2)	
40 MHz to $> 6$ CHz (con be extended to $< 20$ MHz)	[ER3DV6]
Linearity: $\pm 0.2$ dB (100 MHz to 3 GHz)	
+ 0.2 dB in air (rotation around probe axis)	
(	
2 V/m to > 1000 V/m; Linearity: ± 0.2 dB	
Overall length: 330 mm (Tip: 16 mm)	
Tip diameter: 8 mm (Body: 12 mm)	
Distance from probe tip to dipole centers: 2.5 mm	
General near-field measurements up to 6 GHz	
Field component measurements	
Fast automatic scanning in phantoms	
	<ul> <li>Built-in shielding against static charges PEEK enclosure material</li> <li>In air from 100 MHz to 3.0 GHz (absolute accuracy ±6.0%, k=2)</li> <li>40 MHz to &gt; 6 GHz (can be extended to &lt; 20 MHz) Linearity: ± 0.2 dB (100 MHz to 3 GHz)</li> <li>± 0.2 dB in air (rotation around probe axis) ± 0.4 dB in air (rotation normal to probe axis)</li> <li>2 V/m to &gt; 1000 V/m; Linearity: ± 0.2 dB</li> <li>Overall length: 330 mm (Tip: 16 mm) Tip diameter: 8 mm (Body: 12 mm)</li> <li>Distance from probe tip to dipole centers: 2.5 mm</li> <li>General near-field measurements up to 6 GHz Field component measurements</li> </ul>

### 6.3Test Arch Phantom & Phone Positioner

The Test Arch phantom should be positioned horizontally on a stable surface. Reference markings on the Phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot. It enables easy and well defined positioning of the phone and validation dipoles as well as simple teaching of the robot (Dimensions:  $370 \times 370 \times 370 \text{ mm}$ ).

The Phone Positioner supports accurate and reliable positioning of any phone with effect on near field < $\pm$ 0.5 dB.

Fig. 2 HAC Phantom & Device Holder

### 6.4 Robotic System Specifications

#### **Specifications**

Positioner: Stäubli Unimation Corp. Robot Model: RX160L Repeatability: ±0.02 mm No. of Axis: 6 Data Acquisition Electronic (DAE) System Cell Controller Processor: Intel Core2 Clock Speed: 1.86GHz Operating System: Windows XP Data Converter Features:Signal Amplifier, multiplexer, A/D converter, and control logic Software: DASY5 software Connecting Lines: Optical downlink for data and status info. Optical uplink for commands and clock

# 7 EUT ARRANGEMENT

### 7.1 WD RF Emission Measurements Reference and Plane

Figure 4 illustrates the references and reference plane that shall be used in the WD emissions measurement.

- The grid is 5 cm by 5 cm area that is divided into 9 evenly sized blocks or sub-grids.
- The grid is centered on the audio frequency output transducer of the WD (speaker or T-coil).

The grid is located by reference to a reference plane. This reference plane is the planar area that contains the highest point in the area of the WD that normally rests against the user's ear
The measurement plane is located parallel to the reference plane and 15 mm from it, out from the phone. The grid is located in the measurement plane.

Fig. 3 WD reference and plane for RF emission measurements

### **8 SYSTEM VALIDATION**

### 8.1 Validation Procedure

Place a dipole antenna meeting the requirements given in ANSI C63.19 in the position normally occupied by the WD. The dipole antenna serves as a known source for an electrical output. Position the E-field probes so that:

•The probes and their cables are parallel to the coaxial feed of the dipole antenna

•The probe cables and the coaxial feed of the dipole antenna approach the measurement area from opposite directions

• The center point of the probe element(s) are 15 mm from the closest surface of the dipole elements.

Fig. 4 Dipole Validation Setup

#### 8.2 Validation Result

	E-Field Scan								
Mode	Frequency (MHz)	Input Power (mW)	Measured <sup>1</sup> Value(dBV/m)	Target <sup>2</sup> Value(dBV/m)	Deviation <sup>3</sup> (%)	Limit⁴ (%)			
CW	835	100	40.54	40.64	-1.14	±25			
CW	1880	100	38.49	38.87	-4.28	±25			
CW	2600	100	37.94	38.48	-6.03	±25			

Notes:

1. Please refer to the attachment for detailed measurement data and plot.

2. Target value is provided by SPEAD in the calibration certificate of specific dipoles.

3. Deviation (%) = 100 \* (Measured value minus Target value) divided by Target value.

4. ANSI C63.19 requires values within  $\pm$  25% are acceptable, of which 12% is deviation and 13% is measurement uncertainty. Values independently validated for the dipole actually used in the measurements should be used, when available.

## 9 Evaluation of MIF

### 9.1 Introduction

The MIF (Modulation Interference Factor) is used to classify E-field emission to determine Hearing Aid Compatibility (HAC). It scales the power-averaged signal to the RF audio interference level and is characteristic to a modulation scheme. The HAC standard preferred "indirect" measurement method is based on average field measurement with separate scaling by the MIF. With an Audio Interference Analyzer (AIA) designed by SPEAG specifically for the MIF measurement, these values have been verified by practical measurements on an RF signal modulated with each of the waveforms. The resulting deviations from the simulated values are within the requirements

of the HAC standard.

The AIA (Audio Interference Analyzer) is an USB powered electronic sensor to evaluate signals in the frequency range 698MHz - 6 GHz. It contains RMS detector and audio frequency circuits for sampling of the RF envelope.

Fig. 5 AIA Front View

### 9.2 MIF measurement with the AIA

The MIF is measured with the AIA as follows:

- 1. Connect the AIA via USB to the DASY5 PC and verify the configuration settings.
- 2. Couple the RF signal to be evaluated to an AIA via cable or antenna.
- 3. Generate a MIF measurement job for the unknown signal and select the measurement port and timing settings.
- 4. Document the results via the post processor in a report.

### 9.3 Test equipment for the MIF measurement

No.	Name	Туре	Serial Number	Manufacturer
01	Signal Generator	MG3700A	6201052605	Anritsu
02	AIA	AIA SE UMS 170 CB		SPEAG
03	BTS CMW500		166370	R&S

### 9.4 DUT MIF results

Based on the KDB285076D01v05, the handset can also use the MIF values predetermined by the test equipment manufacturer. MIF values applied in this test report were provided by the HAC equipment provider of SPEAG, and the worst values for all air interface are listed below to be determine the Low-power Exemption.

Typical MIF levels in ANSI C63.19-2011						
Transmission protocol	Modulation interference					
	factor					
GSM-FDD (TDMA, GMSK)	+3.63 dB					
UMTS-FDD(WCDMA, AMR)	-25.43dB					
LTE-FDD (SC-FDMA, 1RB, 20MHz, QPSK)	-15.63 dB					
LTE-FDD (SC-FDMA, 1RB, 20MHz, 16QAM)	-9.76 dB					
LTE-TDD (SC-FDMA, 1RB, 20MHz, QPSK)	-1.62 dB					
LTE-TDD (SC-FDMA, 1RB, 20MHz, 16QAM)	-1.44 dB					
LTE-TDD(SC-FDMA,1RB,20MHz,QPSK,UL Subframe=2,3,4,7,8,9)	-3.41 dB					
LTE-TDD(SC-FDMA,1RB,20MHz,16QAM,UL Subframe=2,3,4,7,8,9)	-3.17 dB					

### **10 Evaluation for low-power exemption**

### **10.1 Product testing threshold**

There are two methods for exempting an RF air interface technology from testing. The first method requires evaluation of the MIF for the worst-case operating mode. An RF air interface technology of a device is exempt from testing when its average antenna input power plus its MIF is  $\leq$  17 dBm for any of its operating modes. The second method does not require determination of the MIF. The RF emissions testing exemption shall be applied to an RF air interface technology in a device whose peak antenna input power, averaged over intervals  $\leq$  50  $\mu$  s20, is  $\leq$  23 dBm. An RF air interface technology that is exempted from testing by either method shall be rated as M4.

The first method is used to be exempt from testing for the RF air interface technology in this report.

Band	Average power (dBm)	MIF (dB)	Sum (dBm)	C63.19 Tested
GSM 850 - Voice	33	3.63	36.63	Yes
GSM 1900 - Voice	30.5	3.63	34.13	Yes
WCDMA 850 - RMC	23.5	-25.43	-1.93	No
WCDMA 1700 - RMC	23.5	-25.43	-1.93	No
WCDMA 1900 - RMC	23	-25.43	-2.43	No
LTE Band 12 QPSK	23.5	-15.63	7.87	No
LTE Band 13 QPSK	23.5	-15.63	7.87	No
LTE Band 25 QPSK	23.5	-15.63	7.87	No
LTE Band 26 QPSK	23.5	-15.63	7.87	No
LTE Band 66 QPSK	23.5	-15.63	7.87	No
LTE Band 71 QPSK	23.5	-15.63	7.87	No
LTE Band 41(PC2) QPSK	26.5	-1.62	24.88	Yes
LTE Band 41(PC3) QPSK	23.5	-3.41	20.09	Yes
LTE Band 12 16QAM	22.5	-9.76	12.74	No
LTE Band 13 16QAM	22.5	-9.76	12.74	No
LTE Band 25 16QAM	22.5	-9.76	12.74	No
LTE Band 26 16QAM	22.5	-9.76	12.74	No
LTE Band 66 16QAM	22.5	-9.76	12.74	No
LTE Band 71 16QAM	22.5	-9.76	12.74	No
LTE Band 41(PC2) 16QAM	25.5	-1.44	24.06	Yes
LTE Band 41(PC3) 16QAM	22.5	-3.17	19.33	Yes

### 10.2 Conducted power

©Copyright. All rights reserved by CTTL.

### **10.3 Conclusion**

According to the above table, the sums of average power and MIF for WCDMA and LTE FDD are less than 17dBm. So it is measured for GSM and LTE TDD bands. The WCDMA and LTE FDD are exempt from testing and rated as M4.

### 11 RF TEST PROCEDUERES

#### The evaluation was performed with the following procedure:

- 1) Confirm proper operation of the field probe, probe measurement system and other instrumentation and the positioning system.
- 2) Position the WD in its intended test position. The gauge block can simplify this positioning.
- 3) Configure the WD normal operation for maximum rated RF output power, at the desired channel and other operating parameters (e.g., test mode), as intended for the test.
- 4) The center sub-grid shall centered on the center of the T-Coil mode axial measurement point or the acoustic output, as appropriate. Locate the field probe at the initial test position in the50 mm by 50 mm grid, which is contained in the measurement plane. If the field alignment method is used, align the probe for maximum field reception.
- 5) Record the reading.
- 6) Scan the entire 50 mm by 50 mm region in equally spaced increments and record the reading at each measurement point. The distance between measurement points shall be sufficient to assure the identification of the maximum reading.
- 7) Identify the five contiguous sub-grids around the center sub-grid whose maximum reading is the lowest of all available choices. This eliminates the three sub-grids with the maximum readings. Thus, the six areas to be used to determine the WD's highest emissions are identified.
- 8) Identify the maximum field reading within the non-excluded sub-grids identified in Step 7)
- 9) Evaluate the MIF and add to the maximum steady-state rms field-strength reading to obtain the RF audio interference level..
- 10) Compare this RF audio interference level with the categories and record the resulting WD category rating.

# 12 Measurement Results (E-Field)

Note: For LTE Band 41, UL-DL Configuration 1 was used to evaluate Power Class 2 and UL-DL Configuration 0 as used to evaluate Power Class 3.

# 13 ANSIC 63.19-2011 LIMITS

### WD RF audio interference level categories in logarithmic units

Emission categories	< 960 MHz E	-field emissions
Category M1	50 to 55	dB (V/m)
Category M2	45 to 50	dB (V/m)
Category M3	40 to 45	dB (V/m)
Category M4	< 40	dB (V/m)
Emission categories	> 960 MHz E	-field emissions
Category M1	40 to 45	dB (V/m)
Category M2	35 to 40	dB (V/m)
Category M3	30 to 35	dB (V/m)
Category M4	< 30	dB (V/m)

### **16 CONCLUSION**

The HAC measurement indicates that the EUT complies with the HAC limits of the ANSIC63.19-2011. The total M-rating is **M4.**

#### Calibration Laboratory of Schmid & Partner Engineering AG Zeughausstrasse 43, 8004 Zurich, Switzerland

Schweizerischer Kalibrierdienst Service suisse d'étalonnage Servizio svizzero di taratura Swiss Calibration Service

S

С

S

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

#### **Glossary:**

Glossary.	
NORMx,y,z	sensitivity in free space
DCP	diode compression point
CF	crest factor (1/duty_cycle) of the RF signal
A, B, C, D	modulation dependent linearization parameters
En	incident E-field orientation normal to probe axis
Ep	incident E-field orientation parallel to probe axis
Polarization φ	φ rotation around probe axis
Polarization 9	θ rotation around an axis that is in the plane normal to probe axis (at measurement center),
	i.e., $\vartheta = 0$ is normal to probe axis
Connector Angle	information used in DASY system to align probe sensor X to the robot coordinate system

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1309-2005, " IEEE Standard for calibration of electromagnetic field sensors and probes, excluding antennas, from 9 kHz to 40 GHz", December 2005
- b) CTIA Test Plan for Hearing Aid Compatibility, Rev 3.1.1, May 2017

#### Methods Applied and Interpretation of Parameters:

- NORMx, y, z: Assessed for E-field polarization 9 = 0 for XY sensors and 9 = 90 for Z sensor (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart).
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z: A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- Spherical isotropy (3D deviation from isotropy): in a locally homogeneous field realized using an open waveguide setup.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).

Certificate No: EF3-4062\_Dec20

### DASY/EASY - Parameters of Probe: EF3DV3 - SN:4062

#### **Basic Calibration Parameters**

	Sensor X	Sensor Y	Sensor Z	Unc (k=2)
Norm $(\mu V/(V/m)^2)$	0.69	0.78	1.19	± 10.1 %
DCP (mV) <sup>B</sup>	96.6	94.4	89.2	

#### Calibration results for Frequency Response (30 MHz - 6 GHz)

Frequency MHz	Target E-Field V/m	Measured E-field (En) V/m	Deviation E-normal in %	Measured E-field (Ep) V/m	Deviation E-normal in %	Unc (k=2) %
30	77.2	77.1	-0.1%	76.9	-0.3%	± 5.1 %
100	77.3	78.2	1.2%	78.2	1.3%	± 5.1 %
450	77.1	78.1	1.3%	78.3	1.5%	± 5.1 %
600	77.2	77.7	0.8%	77.7	0.8%	± 5.1 %
750	77.3	77.6	0.6%	77.5	0.5%	± 5.1 %
1800	140.3	139.6	-2.6%	139.5	-2.7%	± 5.1 %
2000	133.0	131.8	-2.6%	132.1	-2.4%	± 5.1 %
2200	125.1	123.8	-3.1%	125.2	-2.0%	± 5.1 %
2500	123.7	122.1	-2.3%	123.4	-1.2%	± 5.1 %
3000	78.9	76.2	-4.3%	77.6	-2.5%	± 5.1 %
3500	250.5	242.1	-5.6%	239.0	-6.8%	± 5.1 %
3700	244.2	235.5	-5.6%	235.6	-5.6%	± 5.1 %
5200	50.8	52.2	2.9%	51.9	2.4%	± 5.1 %
5500	49.7	50.0	0.7%	48.5	-2.4%	± 5.1 %
5800	48.9	49.1	0.4%	50.1	2.3%	± 5.1 %

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>B</sup> Numerical linearization parameter: uncertainty not required.
<sup>E</sup> Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

Note: For details on UID parameters see Appendix

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>B</sup> Numerical linearization parameter: uncertainty not required.
<sup>E</sup> Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the result. field value.

#### Methods Applied and Interpretation of Parameters:

- Coordinate System: y-axis is in the direction of the dipole arms. z-axis is from the basis of the antenna (mounted on the table) towards its feed point between the two dipole arms. x-axis is normal to the other axes. In coincidence with the standards [1], the measurement planes (probe sensor center) are selected to be at a distance of 15 mm above the top metal edge of the dipole arms.
- Measurement Conditions: Further details are available from the hardcopies at the end of the certificate. All
  figures stated in the certificate are valid at the frequency indicated. The forward power to the dipole connector
  is set with a calibrated power meter connected and monitored with an auxiliary power meter connected to a
  directional coupler. While the dipole under test is connected, the forward power is adjusted to the same level.
- Antenna Positioning: The dipole is mounted on a HAC Test Arch phantom using the matching dipole positioner with the arms horizontal and the feeding cable coming from the floor. The measurements are performed in a shielded room with absorbers around the setup to reduce the reflections. It is verified before the mounting of the dipole under the Test Arch phantom, that its arms are perfectly in a line. It is installed on the HAC dipole positioner with its arms parallel below the dielectric reference wire and able to move elastically in vertical direction without changing its relative position to the top center of the Test Arch phantom. The vertical distance to the probe is adjusted after dipole mounting with a DASY5 Surface Check job. Before the measurement, the distance between phantom surface and probe tip is verified. The proper measurement distance is selected by choosing the matching section of the HAC Test Arch phantom with the proper device reference point (upper surface of the dipole) and the matching grid reference point (tip of the probe) considering the probe sensor offset. The vertical distance to the probe is essential for the accuracy.
- Feed Point Impedance and Return Loss: These parameters are measured using a Vector Network Analyzer. The impedance is specified at the SMA connector of the dipole. The influence of reflections was eliminating by applying the averaging function while moving the dipole in the air, at least 70cm away from any obstacles.
- E-field distribution: E field is measured in the x-y-plane with an isotropic E-field probe with 100 mW forward power to the antenna feed point. In accordance with [1], the scan area is 20mm wide, its length exceeds the dipole arm length (180 or 90mm). The sensor center is 15 mm (in z) above the metal top of the dipole arms. Two 3D maxima are available near the end of the dipole arms. Assuming the dipole arms are perfectly in one line, the average of these two maxima (in subgrid 2 and subgrid 8) is determined to compensate for any non-parallelity to the measurement plane as well as the sensor displacement. The E-field value stated as calibration value represents the maximum of the interpolated 3D-E-field, in the plane above the dipole surface.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Page 2 of 5

#### **Measurement Conditions**

DASY system configuration, as far as not given on page 1.

DASY Version	DASY5	V52.10.4
Phantom	HAC Test Arch	
Distance Dipole Top - Probe Center	15 mm	
Scan resolution	dx, dy = 5 mm	
Frequency	835 MHz ± 1 MHz	2723
Input power drift	< 0.05 dB	

#### Maximum Field values at 835 MHz

E-field 15 mm above dipole surface	condition	Interpolated maximum
Maximum measured above high end	100 mW input power	107.7 V/m = 40.64 dBV/m
Maximum measured above low end	100 mW input power	107.3 V/m = 40.61 dBV/m
Averaged maximum above arm	100 mW input power	107.5 V/m ± 12.8 % (k=2)

#### Appendix (Additional assessments outside the scope of SCS 0108)

#### **Antenna Parameters**

Frequency	Return Loss	Impedance
800 MHz	17.1 dB	41.3 Ω - 9.5 jΩ
835 MHz	24.9 dB	52.8 Ω + 5.2 jΩ
880 MHz	16.5 dB	62.0 Ω - 11.9 jΩ
900 MHz	16.5 dB	53.1 Ω - 15.3 jΩ
945 MHz	25.4 dB	46.2 Ω + 3.5 jΩ

#### 3.2 Antenna Design and Handling

The calibration dipole has a symmetric geometry with a built-in two stub matching network, which leads to the enhanced bandwidth.

The dipole is built of standard semirigid coaxial cable. The internal matching line is open ended. The antenna is therefore open for DC signals.

Do not apply force to dipole arms, as they are liable to bend. The soldered connections near the feedpoint may be damaged. After excessive mechanical stress or overheating, check the impedance characteristics to ensure that the internal matching network is not affected.

After long term use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
