```
According to 447498 D01 General RF Exposure Guidance v05
The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at
test separation distances \leqslant 50 mm are determined by:
[(max. power of channel, including tune-up tolerance, mW)/(min. test
separation distance, mm)] \bullet [ \sqrt{ f (GHz)] \leqslant 3.0 for 1-g SAR and \leqslant 7.5 for}{l}=1,
10-g extremity SAR, where
    f(GHz) is the RF channel transmit frequency in GHz
    Power and distance are rounded to the nearest mW and mm before
calculation
    The result is rounded to one decimal place for comparison
Ant gain OdBi; so Ant numeric gain=1.0
For Bluetooth BR/EDR
pt=1.111dBm =1.29mW at 2402MHz
So (1.29mW/5mm)x \sqrt{ }{2}.402GHz= 0.3998<3
Then SAR evaluation is not required
```
