5. Reliability Testing:

1.

Test purpose: to verify the lateral pressure resistance of the integrated external antenna of the product, and to test the strength of the antenna itself and the strength of the contact part between the product and the equipment, such as the strength of the shell and the strength of the anti-rotation limit rib.

Preset conditions:

- 1) The electrical properties of the tested samples meet the requirements, and the appearance of the samples has no defects such as cracking and abrasion.
- 2) The antenna is installed on the product in a normal state, and the product is fixed.
- 3) Each test sample shall be at least 3pcs; •

Test steps:

- 1) Before testing, check the appearance and function of the sample to be tested;
- 2) Conduct the following two tests, using two sets of materials respectively:

Test 1: Make the antenna open and straight, apply 20N force inward, outward, upward and downward at the position of 5mm at the antenna end, and keep it for 5S. Repeat this operation for 10 times in each direction.

Antenna lateral pressure test

Test 2: Make the antenna in a 90-degree bending state, and when twisting the antenna until the rotation-stopping limit rib works, apply a force of 20N at the 5mm position at the antenna end, and keep it for 5S, and repeat this operation for 10 times. Complete the test of positive and negative limit positions.

- 3) In the above two groups of tests, if it is found that when the antenna is stressed, the antenna deformation angle is greater than 30 and the external force is still less than 20N, keep the deformation angle at 30, cancel the external force after 5 seconds, and repeat the above operations for 10 times; Complete 4 direction tests, totaling 40 times;
- 4) If there are multiple antennas on the same product, each antenna installation position on the product should be tested.

Criterion:

- 1. The mechanical and electrical functions of the antenna are normal after the test;
- 2. The antenna can be bent manually, the shell is not allowed to break, and the wire core is not allowed to break.
- 3. The limiting rib of the main equipment is cracked, and the buckle of the shell cannot be loosened or broken;
- 4. The electrical performance of the antenna has not changed before and after the test

2.

Test purpose: to verify the durability requirements of the antenna with free rotation function between the antenna fixed head and the antenna body for long-term use; Preset conditions: the electrical properties of the test sample meet the requirements, and the appearance of the sample has no defects such as cracking and wear;

test procedure:

180 °rotatable antenna:

- 1. Before testing, ensure that the mechanical and electrical functions of the antenna are normal, and there can be no physical damage;
- 2. Bend the antenna base into the direction perpendicular to the connector.
- 3. Install the antenna on the fixed platform of the corresponding model, and bend the antenna base to make it perpendicular to the connector.
- 4. Manually or mechanically rotate the antenna base to the horizontal position (90 degrees) to the left, then rotate it to the original position, then rotate the antenna base to the horizontal position (90 degrees) to the right, and then rotate it to the original position, and count the whole reciprocating once.
- 5. The test frequency is 30~40 times per minute, with a total rotation of 1000 times;
- 6. After the test, check the mechanical and electrical performance of the antenna. 360-degree rotatable antenna:

1. Before testing, ensure that the mechanical and electrical functions of the antenna are normal, and there can be no physical damage;

- 2. Bend the antenna base into the direction perpendicular to the connector.
- 2. Install the antenna on the fixed platform of the corresponding model, and bend the antenna base to make it perpendicular to the connector.
- 3. Manually or mechanically rotate 360 degrees to the left to return to the original position, then rotate the antenna base 360 to the right to return to the original position, and count the whole reciprocating twice.
- 4. The test frequency is 30~40 times per minute, with a total rotation of 1000 times;
- 5. After the test, check the mechanical and electrical performance of the antenna.

Criterion:

- 1. After the test, the antenna shall not be obviously physically damaged, and the antenna rotating head has the function of fixing the rotating position of the antenna after the test, and the limit structure of the main equipment is not damaged;
- 2. There is no change in electrical performance before and after the test.

Antenna rotation durability test

3.

Verify whether the drop strength of desktop and handheld terminal meets the requirements during use/handling. Test procedure: Ensure that the mechanical and electrical functions of the sample are normal. Test conditions: 1) Ensure that the mechanical and electrical functions of the sample are normal. 2) The open state of the antenna, together with the falling height of the whole machine of 0.8m,6 faces, one cycle, recorded 6 times in total, marble platform, 3) During the test, it is required to check the appearance and function of each surface to be tested. When the next surface is tested, if the fault is caused, it can be recovered manually, and the test can be carried out after manual recovery. 4) After 1 cycle test is completed, check the mechanical function and electrical function of the sample. Free drop Criterion: test of 4. 1. The mechanical function and electrical function of the sample are normal. the whole 2. Allow manual recoverable mechanical failure to occur. machine 3. Minor mechanical failures that do not affect the normal use and safety of users are allowed.

before the test; 2. Fix the fixed head, and apply a pulling force of 5kgf to the rotating shaft of the antenna and keep it for 2s when the force reaches 5kgf; 3. Repeat the operation step (2) for 20 times; 4. Fix the rotating shaft of the antenna, and apply a pulling force of 5kgf to the antenna end, and keep it for 2s when the force reaches 5kgf; 5. Repeat the operation step (4) for 20 times. Criterion: 1. There shall be no obvious physical damage to the antenna after the test is completed. 2. There is no change in electrical performance before and after the test. Test purpose: to verify whether the installation force of antenna in production and assembly meets the requirements of human comfort; Preset conditions: ONT and antenna must be brand-new samples and installed for the first time; The second installation will obviously reduce the installation force due to the wear of structural parts, which will lead to invalid test data; Test process:			
Preset conditions: the electrical properties of the test sample meet the requirements, and the appearance of the sample has no defects such as cracking and wear; Test process: 1, the initial inspection before the test, to ensure that the prototype parts function normally before the test; 2. Fix the fixed head, and apply a pulling force of 5kgf to the rotating shaft of the antenna and keep it for 2s when the force reaches 5kgf; 3. Repeat the operation step (2) for 20 times; 4. Fix the rotating shaft of the antenna, and apply a pulling force of 5kgf to the antenna end, and keep it for 2s when the force reaches 5kgf; 5. Repeat the operation step (4) for 20 times. Criterion: 1. There shall be no obvious physical damage to the antenna after the test is completed. 2. There is no change in electrical performance before and after the test. Antenna installation force is less than 30N; Antenna abnormal sound test Test purpose: to verify that the antenna has no abnormal noise during shaking; Test criterion: manually shake the single antenna	6.		1. Initial inspection before testing to ensure that the ONT shell and antenna are brand-new
housing; You can use a press to record the antenna installation force. 3. Number of prototypes: 13pcs Checkpoints, requirements, indicators and expected results: 1. Antenna installation force is less than 30N; 7. Antenna abnormal sound test Test purpose: to verify that the antenna has no abnormal noise during shaking; Test criterion: manually shake the single antenna		n force	prototypes, and the antenna has not been installed;
3. Number of prototypes: 13pcs Checkpoints, requirements, indicators and expected results: 1. Antenna installation force is less than 30N; 7. Antenna abnormal sound test Test purpose: to verify that the antenna has no abnormal noise during shaking; Test criterion: manually shake the single antenna			2. Fix the ONT housing and press the antenna into the antenna mounting hole of the ONT
Checkpoints, requirements, indicators and expected results: 1. Antenna installation force is less than 30N; Antenna abnormal sound test Test purpose: to verify that the antenna has no abnormal noise during shaking; Test criterion: manually shake the single antenna			housing; You can use a press to record the antenna installation force.
results: 1. Antenna installation force is less than 30N; Antenna abnormal sound test Test purpose: to verify that the antenna has no abnormal noise during shaking; Test criterion: manually shake the single antenna			3. Number of prototypes: 13pcs
7. Antenna abnormal sound test Test purpose: to verify that the antenna has no abnormal noise during shaking; Test criterion: manually shake the single antenna			Checkpoints, requirements, indicators and expected
abnormal sound test Test purpose: to verify that the antenna has no abnormal noise during shaking; Test criterion: manually shake the single antenna			results: 1. Antenna installation force is less than 30N;
abnormal sound test during shaking; Test criterion: manually shake the single antenna		Antenna	Test purpose: to verify that the antenna has no abnormal poise
Sound test	7.	abnormal	

1. Adjust the direction of the main equipment so that the antenna is placed horizontally, and the direction of the antenna rotation force is parallel to the horizontal desktop.(as shown in the figure below) to avoid the influence of antenna gravity on the measurement of rotating force

Schematic diagram of external antenna rotation force test

2. Push the antenna to rotate slowly and uniformly at the end of the antenna 5mm with a thrust meter, and keep the thrust direction perpendicular to the antenna during the rotation (the thrust arm is always equal to the distance from the point where the force acts to the rotating shaft). Take the maximum rotational damping force of the antenna in the process of forward and reverse full-angle rotation, measure it for 3 times, and the average value is f;

8. Rotational force test

3. Measure each external antenna as described above.

The required indicators and expected results to be achieved by the checkpoint: $1.0.6n \le f \le 2.6n$.

2. The lower limit of antenna rotation force shall meet the following requirements:

A the antenna can overcome its own weight and remain in place at any position after the rotation durability test.

B the antenna can overcome its own weight and remain in place at any position after high temperature storage test.

3. The difference of rotational force of the same type of external antenna on the same product is less than 30%, that is, (maximum rotational force Fmax- minimum rotational force Fmin)/ minimum rotational force fmin is less than 30%.

Test description:

- 1. The number of test samples is 3pcs. The number of test samples means that there are 2pcs antennas on the main equipment, so the total number of antennas tested is 6pcs.
- 2. This use case is suitable for investigating the matching performance between the external antenna device and the main equipment shell.

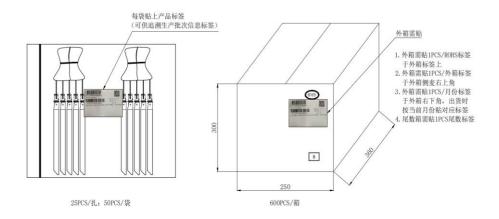

6. Environmental Protection

Meet the requirements of ROHS2.0 standard, meet the requirements of European RHOS\REACH, meet the requirements of China RHOS\REACH, and lead-free electroplating. \circ

7. Packing

Incoming packaging	 The antenna monomer is packed in PE plastic bags, and then packed in the outer packing box; Stick the product label on the outer packing box; Traceable production batch information label 	See the figure below for details.

8. Environmental Requirement:

environmental	Index	引用标准
parameter	index	
Storage	-60∼+75	
temperature range		
(℃)		
operating temperature range	-60 \sim +75	
(℃)		
Storage humidity	40°C, 95% humidity, 96 hours	Reference
range		standard: IEC
Operating	5%~95%	60068-2-
humidity range		1/2/6/14/30/31/78 ETSI EN 300 019-
	1) Check the test surface to keep it clean and dry, and at the	2-1/2/3 GR-63-
	same time, there are no bubbles and scratches on the product	CORE
	surface.	
	2) put the sample into a constant temperature and humidity	
	box, keep the temperature at $+25^{\circ}$ C, and raise the humidity to	
	95%RH within 1 hour.	
	3) keep the humidity at 95% RH; Heating to+55 DEG C	
	within 3 hours;	
	4) Maintain +55°C and 95% RH for 9 hours.	
	5) keep the humidity at 95% RH; Cooling to+25 DEG C	
	within 3 hours;	
Alternating damp heat	7) Repeat steps 2) to 5) for 5 times (6 cycles in total);	
	8) Keep the temperature at $+25^{\circ}$ C and reduce the humidity to	
	50% within 1 hour;	
	9) Maintain +25°C and 50% RH for 2 hours.	
	Requirements, indicators and expected results to be achieved	
	by the checkpoint:	

	1) Check the test surface to keep it clean and dry, and at the	
	same time, there are no bubbles and scratches on the product	
	surface.	
	2) putting the product into a cold and hot shock test box,	Reference
	cooling to -40 $^{\circ}\text{C}$ at a rate of 1 $^{\circ}\text{C}/\text{min}$, and keeping it at -40 $^{\circ}\text{C}$	standard:
	for 4 hours;	IEC
	3) Put the product into a cold and hot shock test box, raise the	60068-2- 1/2/6/14/30/31/78E
	temperature to $+80^{\circ}$ C at a rate of 1° C/min, and keep it at	TSI EN 300 019-2-
	+80°C for 4 hours. 4) Repeat the previous two steps for 8	1/2/3 GR-63-CORE
	times (9 cycles in total). And check the electrical performance	
temperature cycle	of the equipment. 5) Raise the temperature to +25°C at the	
	rate of 1°C/min and keep it for 24 hours. 6) Test the adhesion	
	of the test surface with "adhesive tape method".	
	Requirements, indicators and expected results to be achieved	
	by the checkpoint:	
	1. The antenna should not be discolored, cracked, degummed	
	or warped.	
	Loss of function and so on.	
	2. The damping force of antenna and ONT has no obvious	
	change, but the antenna and ONT have no obvious change.	
		i e

	Heating to 70°C at the rate of 1°C/min, and keeping at 70°C
	for 24 hours; The temperature was reduced to +25°C at the
	rate of 1°C/min and kept for 2 hours.
High temperature storage	Minimum sample size: 3pcs
	Requirements, indicators and expected results to be achieved
	by the checkpoint:
	1. The antenna shall not be discolored, cracked, degummed,
	warped and deformed, or lose its function.
	2. The damping force between the antenna and ONT has no
	obvious change, and the damping force matched with the
	product can keep the antenna at any angle.
	Stability;

		Cooling to -40°C at the rate of 1°C/min, and keeping at -	
Cryogenic storage		40°C for 24 hours; Heating to 1°C/min.	
		+25°C for 2 hours.	
		Requirements, indicators and expected results to be	
		achieved by the checkpoint:	
		1. The antenna shall not be discolored, cracked,	
		degummed, warped and deformed, or lose its function.	
		2. The damping force between the antenna and ONT has	
		, ,	
		no obvious change, and the damping force matched with	
		the product can keep the antenna at any angle.	
		Stability;	
Constant salt spray		72 hours salt spray test, after the test, the product index at	
		room temperature,	
		All functions and mechanical properties are normal.	
Illumination		/	
Bare metal vibration		Requirements;
