Issue Date: 01-22-2016

## RF Exposure Evaluation Declaration

---

**FCC ID:** 2AD6M-X20

**APPLICANT:** P2 Mobile Technologies Limited

**Application Type:** Certification

**Product:** MeshRanger X20 Dual 5GHz 802.11ac

**Model No.:** X20

**FCC Classification:** Unlicensed National Information Infrastructure (UNII)

Reviewed By : Robin Wu

## 1. PRODUCT INFORMATION

### 1.1. Equipment Description

|  |   |
|--|---|
| Product Name                                   | MeshRanger X20 Dual 5GHz 802.11ac   |
| Model No.                                      | X20   |
| Frequency Range                                | For 802.11a/n-HT20/ac-VHT20:<br>5180~5240MHz, 5745~5825MHz<br>For 802.11n-HT40/ac-VHT40:<br>5190~5230MHz, 5755~5795MHz<br>For 802.11ac-VHT80:<br>5210MHz, 5775MHz |
| Type of Modulation                             | 802.11a/n/ac: OFDM  |
| Maximum Average Output Power with 5GHz Card #1 | 802.11a: 29.31dBm<br>802.11n-HT20: 29.19dBm<br>802.11n-HT40: 28.47dBm<br>802.11ac-VHT20: 29.29dBm<br>802.11ac-VHT40: 28.67dBm<br>802.11ac-VHT80: 20.85dBm         |
| Maximum Average Output Power with 5GHz Card #2 | 802.11a: 28.60dBm<br>802.11n-HT20: 28.52dBm<br>802.11n-HT40: 28.05dBm<br>802.11ac-VHT20: 28.58dBm<br>802.11ac-VHT40: 28.08dBm<br>802.11ac-VHT80: 14.30dBm         |

## 1.2. Antenna Description

| Antenna Type  | Frequency Band (GHz) | Tx Paths | Max Peak Gain (dBi) | Beam Forming Directional Gain (dBi) | CDD Directional Gain (dBi) |         |
|---|----------------------|----------|---------------------|-------------------------------------|----------------------------|---------|
|   |                      |          |                     |                                     | For Power                  | For PSD |
| Internal Antenna  |                      |          |                     |                                     |                            |         |
|  | 5                    | 2        | 18                  | 21                                  | 18                         | 21      |
| External Antenna  |                      |          |                     |                                     |                            |         |
|  | 5                    | 2        | 20                  | 23                                  | 20                         | 23      |

- The EUT supports Cyclic Delay Diversity (CDD) mode, and CDD signals are correlated.  
For CDD transmissions, directional gain is calculated as follows,  $N_{ANT} = 2$ ,  $N_{SS} = 1$ .
  - If all antennas have the same gain,  $G_{ANT}$ , Directional gain =  $G_{ANT} + \text{Array Gain}$ , where Array Gain is as follows.
    - For power spectral density (PSD) measurements on all devices,  
Array Gain =  $10 \log (N_{ANT}/N_{SS})$  dB = 3.01;
    - For power measurements on IEEE 802.11 devices,  
Array Gain = 0 dB for  $N_{ANT} \leq 4$ ;
- The EUT supports Beam Forming technology for 802.11n/ac mode, and exclude 802.11a mode.  
Correlated signals include, but are not limited to, signals transmitted in any of the following modes:  
Any transmit Beam Forming mode, whether fixed or adaptive (e.g., phased array modes, closed loop MIMO modes, Transmitter Adaptive Antenna modes, Maximum Ratio Transmission (MRT) modes, and Statistical Eigen Beam Forming (EBF) modes).
  - All antennas have the same gain,  $G_{ANT}$ :  
Directional gain =  $G_{ANT} + 10 \log(N_{ANT}/N_{SS})$  dBi, where  $N_{SS}$  = the number of independent spatial streams of data and  $G_{ANT}$  is the antenna gain in dBi.

## 2. RF Exposure Evaluation

### 2.1. Limits

According to FCC 1.1310: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in 1.1307(b)

#### LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

| Frequency Range (MHz)                                     | Electric Field Strength (V/m) | Magnetic Field Strength (A/m) | Power Density (mW/cm <sup>2</sup> ) | Average Time (Minutes) |
|---|-------------------------------|-------------------------------|-------------------------------------|------------------------|
| (A) Limits for Occupational/ Control Exposures            |                               |                               |                                     |                        |
| 300-1500  | --                            | --                            | f/300                               | 6                      |
| 1500-100,000  | --                            | --                            | 5                                   | 6                      |
| (B) Limits for General Population/ Uncontrolled Exposures |                               |                               |                                     |                        |
| 300-1500  | --                            | --                            | f/1500                              | 6                      |
| 1500-100,000  | --                            | --                            | 1                                   | 30                     |

f= Frequency in MHz

Calculation Formula:  $P_d = (P_{out} \cdot G) / (4 \cdot \pi \cdot r^2)$

Where

$P_d$  = power density in mW/cm<sup>2</sup>

$P_{out}$  = output power to antenna in mW

G = gain of antenna in linear scale

$\pi$  = 3.1416

r = distance between observation point and center of the radiator in cm

$P_d$  is the limit of MPE, 1mW/cm<sup>2</sup>. If we know the maximum gain of the antenna and the total power input to the antenna, through the calculation, we will know the distance r where the MPE limit is reached.

## 2.2. Test Result of RF Exposure Evaluation

|           |                                   |
|-----------|-----------------------------------|
| Product   | MeshRanger X20 Dual 5GHz 802.11ac |
| Test Item | RF Exposure Evaluation            |

Antenna Gain refer to section 1.2 in this report.

### For 5GHz Card #1 UNII Band:

| Test Mode  | Frequency Band (MHz) | Maximum Average Output Power (dBm) | Limit (mW/cm <sup>2</sup> ) |
|--|----------------------|------------------------------------|-----------------------------|
| 802.11a/n-HT20/<br>n-H40/ac-VHT20<br>ac-VHT40/ac-VHT80 | 5180 ~ 5240          | 29.31                              | 1                           |
|  | 5745 ~ 5825          | 27.24                              | 1                           |

### For 5GHz Card #2 UNII Band:

| Test Mode  | Frequency Band (MHz) | Maximum Average Output Power (dBm) | Limit (mW/cm <sup>2</sup> ) |
|--|----------------------|------------------------------------|-----------------------------|
| 802.11a/n-HT20/<br>n-H40/ac-VHT20<br>ac-VHT40/ac-VHT80 | 5180 ~ 5240          | 28.60                              | 1                           |
|  | 5745 ~ 5825          | 27.20                              | 1                           |

### CONCULISON:

Both of the WLAN 5GHz Card #1 Band and 5GHz Card #2 Band can transmit simultaneously.

Therefore, the worst-case distance =  $\sqrt{(10^{((29.31\text{dBm}+21\text{dBi})/10)} + 10^{((28.60\text{dBm}+23\text{dBi})/10)}) / (4 \cdot \pi)} = 141.59\text{cm}.$

*The Safety Distance of this equipment was 141.59cm.*
