# 1 Summary of test results

System type: Digital transmission system (DTS)

<i>47 CFR part and section<sup>1</sup></i>	<i>Test</i>	<i>Equivalent to IC radio standard(s)</i>	<i>Page</i>	<i>Result</i>	<i>Note(s)</i>
15.207	AC power line conducted emissions 150 kHz to 30 MHz	RSS-Gen Issue 4, section 8.8	---	Not applicable	1
15.247(a)(1) KDB 558074, section 8	20 dB bandwidth	RSS-247 Issue 2, section 5.1(b)	20	Passed	---
15.247(a)(2) KDB 558074, section 8	6 dB bandwidth	RSS-247 Issue 2, section 5.2(a)	25	Passed	2
2.202(a) ANSI C63.10	Occupied bandwidth (99 %)	RSS-Gen Issue 4, section 6.6	30	For reference only	2
15.247(b) KDB 558074, section 9	Maximum conducted output power	RSS-Gen Issue 4, section 6.12 RSS-247 Issue 2, section 5.4	35	Passed	---
15.247(e) KDB 558074, section 10	Power spectral density	RSS-247 Issue 2, section 5.2(b)	40	Passed	---
15.247(d) KDB 558074, sections 11 & 12	Antenna-port conducted measurements	RSS-247 Issue 2, section 5.5	---	Not applicable	3
15.247(d) KDB 558074, section 13	Band-edge compliance (radiated)	RSS-247 Issue 2, section 5.5	46	Passed	---
15.247(d) KDB 558074, sections 11 & 12	Spurious radiated emissions 9 kHz to 10 <sup>th</sup> harmonic	RSS-Gen Issue 4, section 6.13 RSS-247 Issue 2, section 5.5	51	Passed	---
2.1093	RF radiation exposure evaluation for portable devices	RSS-Gen Issue 4, section 3.2 (exempted from SAR and RF evaluation)	70	Passed	---

Notes:

- 1 EUT is battery powered.
- 2 For systems using digital modulation techniques the 6 dB bandwidth (DTS bandwidth) is regarded as the occupied bandwidth.
- 3 Spurious radiated emissions 9 kHz to 10<sup>th</sup> harmonic performed.

### 3 Equipment under test (EUT)

Product type: Bluetooth enabled item finder  
Model name: CPM6  
Serial number(s): #1 (without housing, with artificial antenna connector)  
#2 (with housing, no artificial antenna connector)  
Manufacturer: CHIPOLO d.o.o.  
Version: Hardware: ---  
Software: ---  
Additional modifications: None  
FCC ID: 2AD85-CPM6  
Application frequency band: 2400.00 MHz to 2483.50 MHz  
Frequency range: 2402.00 MHz to 2480.00 MHz  
Operating frequencies: 2402.00 MHz to 2480.00 MHz  
Channel spacing: 2 MHz  
Number of RF channels: 40  
System type: Digital transmission system (DTS)  
Modulation type(s): GFSK  
Class of emission: F1D  
Antenna type(s): PCB antenna  
Antenna gain(s): approximately 0 dBi  
Power supply: Battery supply  
Nominal voltage: 3.0 V  
Minimum voltage: 2.7 V  
Maximum voltage: 3.2 V  
Nominal frequency: ---  
Temperature range: from -20 °C to +70°C  
Device type:  Portable  Mobile  Fixed

EMV **TESTHAUS** GmbH  
Gustav-Hertz-Straße 35  
94315 Straubing

## 4 Test configuration and mode of operation

### 4.1 Test configuration

Device	Type designation	Serial or inventory no.	Manufacturer
Bluetooth enabled item finder	CPM6	#1	CHIPOLO d.o.o.
Bluetooth enabled item finder	CPM6	#2	CHIPOLO d.o.o.
Notebook	Lifebook A531	E00521	Fujitsu Siemens

Table 1: Devices used for testing

Port	Classification	Cable type	Cable length used	maximum <sup>1</sup>
USB (only for configuration of EUT)	signal/control	Shielded	1.0 m	----

Table 2: Ports of EUT and appropriate cables

### 4.2 Attenuation of test cable(s)

Frequency (MHz)	Attenuation (dB).
2402.0	3.31
2440.0	3.35
2480.0	3.30

Table 3: Attenuation of artificial antenna cable

### 4.3 Mode of operation

EUT was tested in following mode(s) of operation:

- Tx-mode, unmodulated
- Tx-mode, modulated -> PRBS9, data length 16
- Channels:
  - 1 ( 2402 MHz )
  - 20 ( 2440 MHz )
  - 40 ( 2480 MHz )

Applied Software: DirectTestModes (Nordic)

<sup>1</sup> As specified by applicant

## 5 Measurement Procedures

### 5.1 20 dB bandwidth (DTS)

The 20 dB bandwidth test method for DTS systems shall be analog to the 6 dB bandwidth test method for DTS systems.

For test setup see clause 5.8.

### 5.2 6 dB bandwidth (DTS)

The 6 dB bandwidth (DTS bandwidth) test method for DTS systems refers to section 8.0 of KDB 558074 D01 and shall be as follows.

Spectrum analyzer settings:

Span = centered on a channel, wide enough to capture the whole channel

RBW = 100 kHz

VBW  $\geq$  3 x RBW

Sweep time = auto coupled

Detector function = peak

Trace mode = max hold

Reference level: more than  $10\log(\text{OBW}/\text{RBW})$  dB above peak of spectral envelope

Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

If possible, use the automatic bandwidth measurement capability of the spectrum analyzer using the X dB bandwidth mode with X set to 6 dB. Submit this plot(s).

For test setup see clause 5.8.

EMV **TESTHAUS** GmbH  
Gustav-Hertz-Straße 35  
94315 Straubing  
Germany

CHIPOLO d.o.o.  
Bluetooth enabled item finder  
**CPM6**

### **5.3 Occupied bandwidth (99%)**

The occupied bandwidth test method refers to section 6.9.3 of ANSI C63.10 and shall be as follows.

Spectrum analyzer settings:

Span = between 1.5 times and 5.0 times of the OBW, centered on a channel

RBW  $\geq$  in the range of 1% to 5% of the OBW

VBW  $\geq$  approximately three times the RBW

Sweep time = auto coupled

Detector function = peak

Trace mode = max hold

Reference level: more than  $10\log(\text{OBW}/\text{RBW})$  dB above peak of spectral envelope

Use the 99% power bandwidth function of the spectrum analyzer and report the measured bandwidth.

For test setup see clause 5.8.

### **5.4 Maximum conducted output power (DTS)**

The maximum conducted output power test method for DTS systems refers to section 9.1.1 of KDB 558074 D01 and shall be as follows.

Spectrum analyzer settings:

Span  $\geq 3 \times$  RBW, centered on a channel

RBW  $\geq$  DTS bandwidth

VBW  $\geq 3 \times$  RBW

Sweep time = auto coupled

Detector function = peak

Trace mode = max hold

Reference level: more than  $10\log(\text{OBW}/\text{RBW})$  dB above peak of spectral envelope

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the maximum conducted output power. Submit this plot(s).

For test setup see clause 5.8.

EMV **TESTHAUS** GmbH  
Gustav-Hertz-Straße 35  
94315 Straubing  
Germany

CHIPOLO d.o.o.  
Bluetooth enabled item finder  
**CPM6**

## 5.5 Power spectral density

The power spectral density test method refers to section 10.2 of KDB 558074 D01 and shall be as follows.

Spectrum analyzer settings:

Span = 1.5 times the DTS bandwidth, centered on a channel

RBW:  $3 \text{ kHz} \leq \text{RBW} \leq 100 \text{ kHz}$

VBW  $\geq 3 \times \text{RBW}$

Sweep time = auto coupled or  $\geq \text{span}/\text{RBW}$  in seconds, whichever is greater

Detector function = peak

Trace mode = max hold

Reference level: more than  $10\log(\text{OBW}/\text{RBW})$  dB above peak of spectral envelope

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the power spectral density. Submit this plot(s).

For test setup see clause 5.8.

## 5.6 Band-edge compliance (radiated)

For test setup and test method see clause 5.9.

## 5.7 Spurious radiated emissions 9 kHz to 10<sup>th</sup> harmonic

For test setup and test method see clause 5.9.

Bluetooth enabled item finder  
**CPM6**

## 5.8 Conducted emissions at antenna connector

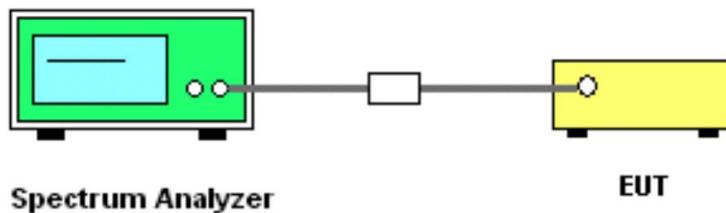

Figure 1: Setup for conducted emission test at antenna connector

The RF signal of the EUT is measured at the antenna connector. In case of no permanent antenna connector, a temporary antenna connector is supplied by the manufacturer. The specific insertion loss of the signal path, which is matched to 50 Ohm, is evaluated within a calibration. The test receiver is set to analyzer mode with pre-selector activated. The measurement readings on the test receiver are corrected by the signal path loss.

Gustav-Hertz-Straße 35  
94315 Straubing  
Germany

CHIPOLO d.o.o.  
Bluetooth enabled item finder  
**CPM6**

## 5.9 Radiated emissions

### 5.9.1 Radiated emissions below 30 MHz

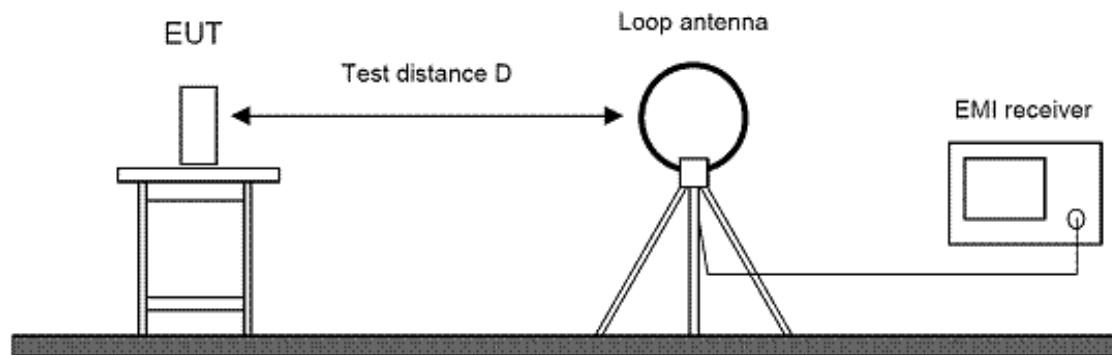

Figure 2: Setup for radiated emission test below 30 MHz

The test method for radiated emissions below 30 MHz refers to section 6.4 of ANSI C63.10 and shall be as follows:

1. EUT is configured according to ANSI C63.10. It is placed on the turntable 0.8 meter above ground. The receiving antenna is located 3 meters from the EUT. The test setup is placed inside a compact diagnostic chamber.
2. EUT and all peripherals are powered on.
3. The loop antenna is set in parallel with the antenna of the EUT.
4. The EMI receiver performs a scan from 9 kHz to 30 MHz with peak detector and measurement bandwidth set to 200 Hz for frequencies up to 150 kHz and 9 or 10 kHz for frequencies above.
5. The turn table is rotated to 8 different positions ( $360^\circ / 8$ ).
6. The antenna is set in line with the antenna of the EUT and steps 4 and 5 are repeated.
7. Then the test setup is placed in an OATS with 3 m distance and all peak values over the limit or with less margin than 10 dB are marked and re-measured with a quasi-peak detector except for the frequency bands 9 to 90 kHz and 110 to 490 kHz, where average detector applies.
8. The turntable is rotated by 360 degrees to determine the position of the highest radiation.
9. The highest value for each frequency is recorded.

## 5.9.2 Radiated emissions from 30 MHz to 1 GHz

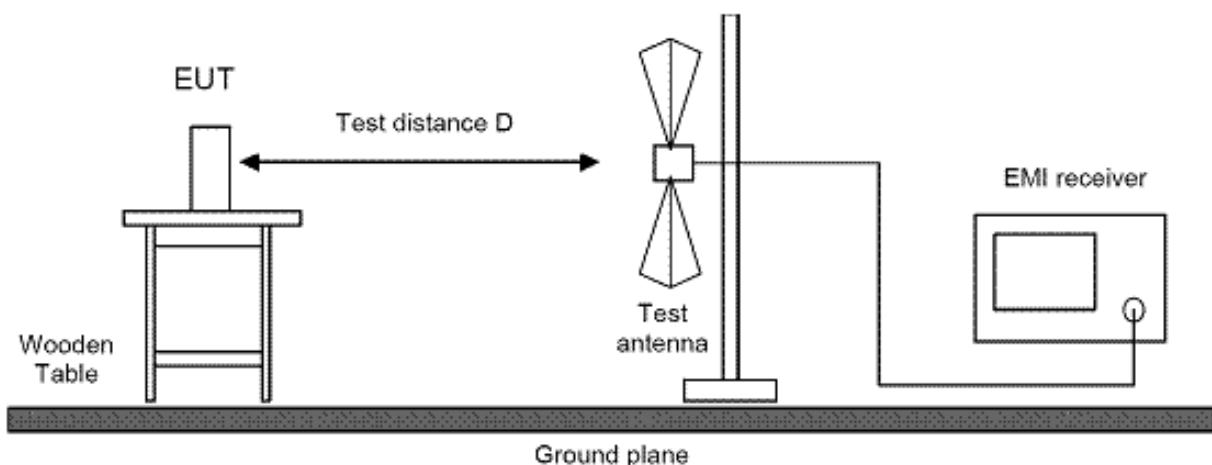

Figure 3: Setup for radiated emission test from 30 MHz to 1 GHz

The test method for radiated emissions from 30 MHz to 1 GHz refers to section 6.5 of ANSI C63.10 and shall be as follows:

1. EUT is configured according to ANSI C63.10. It is placed on the turntable 0.8 meter above ground. The receiving antenna is located 3 meters from the EUT. The test setup is placed inside a compact diagnostic chamber.
2. EUT and all peripherals are powered on.
3. The broadband antenna is set to vertical polarization.
4. The EMI receiver performs a scan from 30 MHz to 1000 MHz with peak detector and measurement bandwidth set to 120 kHz.
5. The turn table is rotated to 6 different positions ( $360^\circ / 6$ ).
6. The antenna polarization is changed to horizontal and steps 4 and 5 are repeated.
7. Then the test setup is placed in an OATS at 3 m distance and all peak values over the limit or with less margin than 10 dB are marked and re-measured with a quasi-peak detector.
8. The turntable is rotated by 360 degrees to determine the position of the highest radiation.
9. The height of the broadband receiving antenna is varied between 1 meter and 4 meters above ground to find the maximum emission field strength of both horizontal and vertical polarization.
10. The highest value for each frequency is recorded.

### 5.9.3 Radiated emissions from above 1 GHz

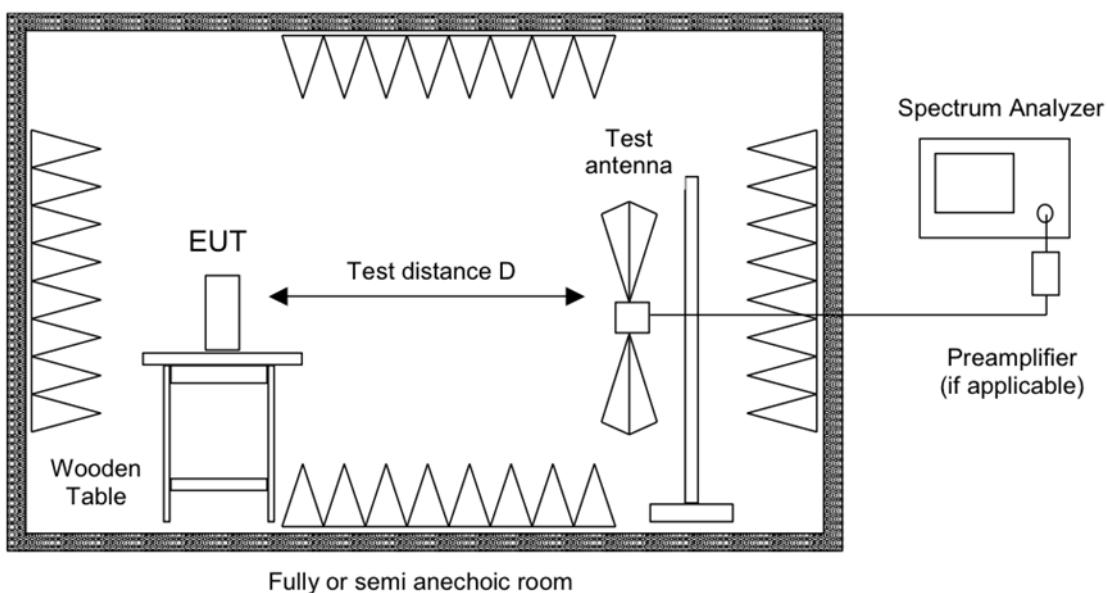

Figure 4: Setup for radiated emission test above 1 GHz

The test method for radiated emissions above 1 GHz refers to section 6.6 of ANSI C63.10 and shall be as follows:

1. EUT is configured according to ANSI C63.10. It is placed on the turntable 1.5 meter above ground. The test setup is placed inside a semi-anechoic chamber with RF absorbers on the floor.
2. EUT and all peripherals are powered on.
3. To identify the critical frequencies, extrapolatory radiated emission tests are performed at a closer distance than 3 meters (e.g. 1 meter). The critical frequencies found are noted.
4. For pre-scan the receiving antenna is located 3 meters from the EUT.
5. The broadband horn antenna is set to vertical polarization.
6. The EMI receiver performs a scan from 1 GHz to the 10<sup>th</sup> harmonic of the fundamental frequency with peak and average detector activated simultaneously and measurement bandwidth set to 1 MHz. The trace data is recorded using the max hold function.
7. The turntable is rotated in steps of 15°.
8. After a full turn by 360° the antenna polarization is changed to horizontal and steps 4 and 5 are repeated.
9. After the scan all peak values over the limit or with less margin than 10 dB are marked. If critical frequencies recorded during extrapolatory radiated emission tests are not contained, they are added to this list.
10. Emission levels at listed frequencies are maximized by moving the turntable and varying the antenna height until maximum of emission is found.
11. The turntable is rotated by 360 degrees to determine the position of the highest radiation.

12. The height of the broadband receiving antenna is varied between 1 meter and the upper height above ground to find the maximum emission field strength of both horizontal and vertical polarization. For equipment that is tested in multiple orientations, the upper height is limited to 2.5 meters or 0.5 meters above the top of the EUT, whichever is higher. For all other equipment the upper height is 4 meters.
13. The highest value for each frequency is recorded.

## 6.7.2 Limits < 1 GHz

Frequency [MHz]	Field strength $F_s$ [ $\mu$ V/m]	Field strength [dB $\mu$ V/m]	Measurement distance $d$ [m]
0.009 – 0.490	266.6 – 4.9	48.5 – 13.8	300
0.490 – 1.705	48.98 – 14.08	33.8 – 22.97	30
1.705 – 30.0	30	29.54	30
30 – 88	100	40	3
88 – 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

Recalculation factor is determined according to ANSI C63.10, section 6.4.4.2 “Extrapolation from the measurement of a single point”:

$$d_{\text{near field}} = 47.77 / f_{\text{MHz}}, \text{ or}$$

$$f_{\text{MHz}} = 47.77 / d_{\text{near field}}$$

The frequency  $f_{\text{MHz}}$  at which the near field distance is equal to the limit and/or test distance is important for selection of the right formula for determining the recalculation factor:

$$f_{\text{MHz}}(300 \text{ m}) \approx 0.159 \text{ MHz}$$

$$f_{\text{MHz}}(30 \text{ m}) \approx 1.592 \text{ MHz}$$

$$f_{\text{MHz}}(3 \text{ m}) \approx 15.923 \text{ MHz}$$

For  $9 \text{ kHz} \leq f \leq 159 \text{ kHz}$  and  $490 \text{ kHz} < f \leq 1.592 \text{ MHz}$ :

$$\text{Recalculation factor} = -40 \log(d_{\text{limit}} / d_{\text{measure}})$$

For  $159 \text{ kHz} < f \leq 490 \text{ kHz}$  and  $1.592 \text{ MHz} < f \leq 15.923 \text{ MHz}$ :

$$\text{Recalculation factor} = -40 \log(d_{\text{near field}} / d_{\text{measure}}) - 20 \log(d_{\text{limit}} / d_{\text{near field}})$$

For  $f > 15.923 \text{ MHz}$ :

$$\text{Recalculation factor} = -20 \log(d_{\text{limit}} / d_{\text{measure}})$$

The limits in the graphics and value lists are derived from the general radiated emission limits as specified in 15.209 using the recalculation factor as described above.

## 6.8 Radio frequency radiation exposure evaluation for portable devices

Reference(s):  
47 CFR Part 2, §2.1093  
KDB 447498 D01, section 4.3.1  
RSS Gen Issue 4, section 3.2  
RSS-102 Issue 5, section 2.5.1

Performed by:	Martin Müller	Date of test:	March 31, 2017
Result:	<input checked="" type="checkbox"/> Test passed	<input type="checkbox"/> Test not passed	

### 6.8.1 Data of equipment under test (EUT)

Antenna connector (see clause 3):	<input type="checkbox"/> permanent	<input checked="" type="checkbox"/> temporary	<input type="checkbox"/> none
Antenna detachable:	<input type="checkbox"/> yes	<input checked="" type="checkbox"/> no	
Tune-up function:	<input type="checkbox"/> yes	<input checked="" type="checkbox"/> no	
Maximum antenna gain (see clause 3):	logarithmic 0.0 dBi	numeric 1.0	
Maximum conducted output power (see clause 6.4):	logarithmic -0.83 dBm	numeric 0.83 mW	
Maximum equivalent isotropically radiated power:	logarithmic -0.83 dBm	numeric 0.83 mW	
Maximum operation frequency (see clause 3):	2480.0 MHz		
Minimum test separation distance:	5 mm		

### 6.8.2 Requirements

To be excluded from SAR tests set out in 47 CFR Part 2, §2.1093, the limits of the general guidelines for RF Exposure as described in KDB 447498 D01, section 4.3.1, have to be kept. For 100 MHz to 6 GHz and test separation distances  $\leq 50$  mm, the 1 g and 10 g SAR test exclusion thresholds are determined by the following equation:

EMV **TESTHAUS** GmbH  
Gustav-Hertz-Straße 35  
94315 Straubing  
Germany

CHIPOLO d.o.o.  
Bluetooth enabled item finder  
**CPM6**

$$\frac{P_{conducted}(mW) \cdot \sqrt{f(GHz)}}{d_{min}(mm)} \leq 3.0$$

with:

- $P_{conducted}$  = source-based time-averaged maximum conducted output power in mW, adjusted for tune-up tolerance
- $f$  = RF channel transmit frequency in GHz
- $d_{min}$  = minimum test separation distance in mm determined by the smallest distance from the antenna and radiating structures or outer surface of the device, according to the host form factor, exposure conditions and platform requirements, to any part of the body or extremity of a user or bystander

EMV **TESTHAUS** GmbH  
Gustav-Hertz-Straße 35

## 6.8.3 Results

### 6.8.3.1 Test results according to KDB 447498 D01

Calculation of minimum test separation distance:

$$\begin{aligned}\frac{P_{conducted}(mW) \cdot \sqrt{f(GHz)}}{d_{min}(mm)} \leq 3.0 &\Leftrightarrow d_{min}(mm) \geq \frac{P_{conducted}(mW) \cdot \sqrt{f(GHz)}}{3.0} \\ &\Leftrightarrow d_{min}(mm) \geq \frac{1 \cdot \sqrt{2.48}}{3.0} \\ &\Leftrightarrow d_{min}(mm) \geq 0.525 \\ &\Rightarrow d_{min}(mm) = 0.6\end{aligned}$$

Final check:

$$\begin{aligned}\frac{P_{conducted}(mW) \cdot \sqrt{f(GHz)}}{d_{min}(mm)} \leq 3.0 &\Leftrightarrow \frac{1 \cdot \sqrt{2.48}}{5} \leq 3.0 \\ &\Rightarrow 0.315 \leq 3.0 \quad \checkmark\end{aligned}$$

Notes:

- 1 Power and distance are rounded to the nearest mW and mm before calculation.
- 2 The result is rounded to one decimal place for comparison

## 8 Measurement uncertainties

Description	Max. deviation	k=
Conducted emission AMN (9kHz to 30 MHz)	± 4.1 dB	2
Carrier frequency separation Number of hopping frequencies Time of occupancy (dwell time)	± 5.0 %	2
Bandwidth tests	± 2.0 %	2
Maximum conducted output power	± 1.5 dB	2
Power spectral density	± 3.0 dB	2
Spurious RF conducted emissions	± 3.0 dB	2
Radiated emission open field or semi-anechoic chamber 9 kHz to 30 MHz 30 MHz to 300 MHz 300MHz to 1 GHz	± 4.8 dB ± 5.4 dB ± 5.9 dB	2
Radiated emission anechoic chamber <td>± 4.5 dB</td> <td>2</td>	± 4.5 dB	2

Table 18: Measurement uncertainty

The uncertainty stated is the expanded uncertainty obtained by multiplying the standard uncertainty by the coverage factor k. For a confidence level of 95 % the coverage factor k is 2.
