## **Maximum Permissible Exposure**

# FCCID: 2AD99DBRDA

#### **Applicable Standard**

Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess limit for maximum permissible exposure. In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as a mobile device whereby a distance of 0.2m normally can be maintained between the user and the device.

Frequency Range (MHz)	Electric Field Strength (E) (V/m)	Magnetic Field Strength (H) (A/m)	Power Density (S) (mW/cm <sup>2</sup> )	Averaging Times $  E  ^2$ , $  H  ^2$ or S (minutes)
0.3-3.0	614	1.63	(100)*	6
3.0-30	1842/f	4.89/f	(900/f)*	6
30-300	61.4	0.163	1.0	6
300-1500			F/300	6
1500-100000			5	6

(a) Limits for Occupational / Controlled Exposure

(b) Limits for General Population / Uncontrolled Exposure

Frequency Range (MHz)	Electric Field Strength (E) (V/m)	Magnetic Field Strength (H) (A/m)	Power Density (S) (mW/cm <sup>2</sup> )	Averaging Times $ E ^2$ , $ H ^2$ or S (minutes)
0.3-1.34	614	1.63	(100)*	30
1.34-30	824/f	2.19/f	(180/f)*	30
30-300	27.5	0.073	0.2	30
300-1500			F/1500	30
1500-100000			1.0	30

Note: f=frequency in MHz; \*Plane-wave equivalent power density

#### **MPE Calculation Method**

 $E(V/m) = (30*P*G)^{0.5}/d$ 

Power Density: Pd  $(W/m^2) = E^2/377$ 

 $\mathbf{E} = \text{Electric Field (V/m)}$ 

 $\mathbf{P}$  = Peak RF output Power (W)

**G** = EUT Antenna numeric gain (numeric)

 $\mathbf{d}$  = Separation distance between radiator and human body (m)

The formula can be changed to

 $\mathbf{Pd} = (30^*P^*G) / (377^*d^2)$ 

From the peak EUT RF output power, the minimum mobile separation distance, d=0.2m, as well as the gain of the used antenna, the RF power density can be obtained.

### **Calculated Result and Limit**

### WIFI Mode:

Antenna Gain (Numeric)	Peak Output Power (dBm)	Peak Output Power (mW)	Power Density (S) (mW/cm <sup>2</sup> )	Limit of Power Density (S) (mW/cm <sup>2</sup> )	Test Result
1.585	20.26	106.2	0.033	1	Compiles

Note: 802.11b was the worse case

#### **RFID Mode:**

Power and distance are rounded to the nearest mW and mm before calculation The result is rounded to one decimal place for comparison

eirp = pt x gt =  $(EXd)^2/30$ 

where:

pt = transmitter output power in watts,

gt = numeric gain of the transmitting antenna (unitless),

 $E = electric field strength in V/m, --- 10^{((dBuV/m)/20)}/10^6$ 

d = measurement distance in meters (m)---3m

So  $pt = (EXd)^2/30 x gt$ 

Field strength = 77.73dBuV/m @3m Ant gain =2dBi ; so Ant numeric gain= 1.585

So pt={  $[_{10}(77.73/20)/10^6 \text{ x3}]^2/30\text{x}1.585$  }x1000 mW =0.011 mW

Antenna Gain (Numeric)	Peak Output Power (mW)	Power Density (S) (mW/cm <sup>2</sup> )	Limit of Power Density (S) (mW/cm <sup>2</sup> )	Test Result
1.585	0.011	0.0035	1	Compiles

0.0035 + 0.033 = 0.0365 < 1
