## RF Exposure Evaluation

The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in 1.1307(b)

Limits for Maximum Permissible Exposure (MPE)

| Frequency range (MHz) | Electric field strength (V/m) | Magnetic field strength ( $\mathrm{A} / \mathrm{m}$ ) | Power density ( $\mathrm{mW} / \mathrm{cm}^{2}$ ) | Averaging time (minutes) |
| :---: | :---: | :---: | :---: | :---: |
| (A) Limits for Occupational/Controlled Exposures |  |  |  |  |
| 0.3-3.0 | 614 | 1.63 | *(100) | 6 |
| 3.0-30 | 1842/f | 4.89/f | *(900/f ${ }^{2}$ ) | 6 |
| 30-300 | 61.4 | 0.163 | 1.0 | 6 |
| 300-1500 |  |  | f/300 | 6 |
| 1500-100,000 |  |  | 5 | 6 |
| (B) Limits for General Population/Uncontrolled Exposure |  |  |  |  |
| 0.3-1.34 | 614 | 1.63 | *(100) | 30 |
| 1.34-30 | 824/f | 2.19/f | *(180/f ${ }^{2}$ ) | 30 |
| 30-300 | 27.5 | 0.073 | 0.2 | 30 |
| 300-1500 |  |  | f/1500 | 30 |
| 1500-100,000 |  |  | 1.0 | 30 |

$\mathrm{f}=$ frequency in MHz
Friis transmission formula: $\mathbf{P d}=\left(\right.$ Pout $\left.^{*} \mathbf{G}\right) /\left(\mathbf{4}^{*} \mathbf{p i}^{\star} \mathbf{r}^{2}\right)$

Where
$\mathbf{P d}=$ power density in $\mathrm{mW} / \mathrm{cm}^{2}$, Pout = output power to antenna in mW ;
$\mathbf{G}=$ gain of antenna in linear scale, $\mathbf{P i}=3.1416$;
$\mathbf{R}=$ distance between observation point and center of the radiator in cm

Pd id the limit of MPE, $1 \mathrm{~mW} / \mathrm{cm}^{2}$. If we know the maximum gain of the antenna and the total power input to the antenna, through the calculation, we will know the distance $r$ where the MPE limit is reached.

## For BLE

According to 447498 D01 General RF Exposure Guidance The $1-\mathrm{g}$ and $10-\mathrm{g}$ SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances > 50 mm are determined by:
\{[Power allowed at numeric threshold for 50 mm in step a$)]+[($ test separation distance $-50 \mathrm{~mm}) \cdot 10]\} \mathrm{mW}$, for $>1500 \mathrm{MHz}$ and $\leq 6 \mathrm{GHz}$
eirp $=p t \mathrm{xgt}=(E X d)^{2} / 30$
where:
$\mathrm{pt}=$ transmitter output power in watts,
$\mathrm{gt}=$ numeric gain of the transmitting antenna (unitless),
$E=$ electric field strength in $\mathrm{V} / \mathrm{m}, \quad \cdots \quad 10^{((\mathrm{dBuV} / \mathrm{m}) / 20)} / 10^{6}$
$\mathrm{d}=$ measurement distance in meters (m) ---3m
So $\mathrm{pt}=(E X d)^{2} / 30 \mathrm{xgt}$

Field strength $=94.93 \mathrm{dBuV} / \mathrm{m} @ 3 \mathrm{~m}$
Ant gain $=0.5 \mathrm{dBi}$, so Ant numeric gain $=1.122$
So $\mathrm{pt}=\left\{\left[10^{94.93 / 20} / 10^{6} \times 3\right]^{2} / 30 \times 1.122\right\} \times 1000 \mathrm{~mW}=0.832 \mathrm{~mW}<96 \mathrm{~mW}$ (illustrated in Appendix B)
