# **Report Scope**

This report addresses the EMC verification testing and test results of the **rES7CD Module**, **with 2.4 GHz BLE Transmitter**. This unit is herein referred to as EUT (Equipment Under Test). The EUT was tested for compliance against the following standards:

RSS-247 Issue 2:2017

FCC Part 15 Subpart C 15.247

Test procedures, results, justifications, and engineering considerations, if any, follow later in this report.

This report does not imply product endorsement by any government, accreditation agency, or TÜV SÜD Canada Inc.

Opinions or interpretations expressed in this report, if any, are outside the scope of TÜV SÜD Canada Inc. accreditations. Any opinions expressed do not necessarily reflect the opinions of TÜV SÜD Canada Inc., unless otherwise stated.

#### Notes, Justifications, or Deviations

The following notes, justifications for tests not performed or deviations from the above listed specifications apply:

For the Antenna requirement specified in FCC 15.203 (RSS-247 section 5.4(d)), the unit is available with the following antenna models, each with less than 6 dBi gain:

- (122-00067-001) Pulse Electronics, 2.4GHz Helical SMD Antenna, Model: W3108, 1.5dBi max gain (Ref: Pulse SMD)
- (122-00060-001) Pulse Electronics, Nitinol Wire Monopole Antenna, Model: W9032, 3dBi max gain (Ref: Chicago Plenum Dual-Band)
- (801-00851-001/2) Pulse Electronics, Stick Monopole Antenna, Model: W1990XXX, 1dBi max gain (Ref: Stubby Dual-Band)

Transmitter spurious radiated emissions and band edges have been evaluated on all three antenna configurations. See *Appendix A* for EUT and antenna configuration details.

All testing is performed while constantly transmitting modulated data at its maximum power (BLE output set to "67").

For the Restricted Bands of operation, the EUT is designed to only operate between 2400 - 2483.5 MHz.

The EUT is not a hybrid system and FCC 15.247 (f) does not apply to it. However, the 15.247 (d) requirement of power density were met and are detailed later in this test report.

The EUT PCB was tested positioned in the three orthogonal axes while coupled with the Chicago Plenum Dual-Band and Stubby Dual-Band antennas in the three orthogonal axes. Worst case results are presented, and occurs with the PCB positioned upright, the Chicago Plenum Dual-Band positioned horizontally, and the Stubby Dual-Band positioned vertically during BLE testing. See *Appendix B* for test photos.

The EUT was configured to 100% duty cycle for testing purposes. However, as declared by the manufacturer, in production, the EUT has a maximum fixed (source based) duty cycle of 4.88% (4.88ms on time/100ms). The duty cycle cannot be changed or modified by either the device or the end user. As per C63.10 Section 7.5 and KDB 558074 Section 8.1, for the average radiated emission measurements of the band edges and of the spurious emissions in the restricted bands, the duty cycle correction factor of 4.88% [ $20\log(4.88\%) = -26.23$ dB] was applied to the peak measurement to obtain the average measurement.

### Sample Calculation(s)

#### **Radiated Emission Test**

E-Field Level = Received Signal + Antenna Factor + Cable Loss - Pre-Amp Gain

 $E\text{-Field Level} = 50dB\mu V + 10dB/m + 2dB - 20dB$ 

E-Field Level =  $42dB\mu V/m$ 

Margin = Limit – E-Field Level Margin =  $50dB\mu V/m - 42dB\mu V/m$ 

Margin = 8.0 dB (pass)

#### **Power Line Conducted Emission Test**

E-Field Level = Received Signal + Attenuation Factor + Cable Loss + LISN Factor

 $E\text{-Field Level} = 50dB\mu V + 10dB + 2.5dB + 0.5dB$ 

E-Field Level =  $63dB\mu V$ 

Margin = Limit – E-Field Level Margin =  $73dB\mu V - 63dB\mu V$ Margin = 10.0 dB (pass)

# **Definitions and Acronyms**

The following definitions and acronyms are applicable in this report. See also ANSI C63.14.

**DTS** – Digital Transmission System

**LISN** – Line Impedance Stabilization Network

**NCR** – No Calibration Required

**NSA** – Normalized Site Attenuation

**N/A** – Not Applicable

**RF** – Radio Frequency

**AE** – Auxiliary Equipment. A digital accessory that feeds data into or receives data from another device (host) that in turn, controls its operation.

**Antenna Port** – Port, other than a broadcast receiver tuner port, for connection of an antenna used for intentional transmission and/or reception of radiated RF energy.

**BW** – Bandwidth. Unless otherwise stated, this refers to the 6 dB bandwidth.

**EMC** – Electro-Magnetic Compatibility. The ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable electromagnetic disturbances to anything in that environment.

**EMI** – Electro-Magnetic Immunity. The ability to maintain a specified performance when the equipment is subjected to disturbance (unwanted) signals of specified levels.

**EUT** – Equipment Under Test. A device or system being evaluated for compliance that is representative of a product to be marketed.

**ITE** – Information Technology Equipment. Has a primary function of entry, storage, display, retrieval, transmission, processing, switching, or control of data and/or telecommunication messages and which may be equipped with one or more ports typically for information transfer.

# **Testing Facility**

Testing for EMC on the EUT was carried out at TÜV SÜD Canada testing lab near Toronto, Ontario. The testing lab has calibrated 3m semi-anechoic chambers which allow measurements on a EUT that has a maximum width or length of up to 2m and a height of up to 3m. The testing lab also has a calibrated 10m Open Area Test Site (OATS). The chambers are equipped with a turntable that is capable of testing devices up to 5000lb in weight and are equipped with a mast that controls the polarization and height of the antenna. Control of the mast occurs in the control room adjoining the shielded chamber. This facility is capable of testing products that are rated for single phase or 3-phase AC input and DC capability is also available. Radiated emission measurements are performed using a BiLog antenna and a Horn antenna where applicable. Conducted emissions, unless otherwise stated, are performed using a LISN and using the vertical ground plane if applicable.

#### Calibrations and Accreditations

The 3m semi-anechoic chamber is registered with Federal Communications Commission (FCC, CA6844), Innovation, Science and Economic Development Canada (ISED, 6844A-3) and Voluntary Control Council for Interference (VCCI, R-14023, G-20072, C-14498, and T-20060). This chamber was calibrated for Normalized Site Attenuation (NSA) using test procedures outlined in ANSI C63.4 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The chamber is lined with ferrite tiles and absorption cones to minimize any undesired reflections. The NSA data is kept on file at TÜV SÜD Canada. For radiated susceptibility testing, a 16 point field calibration has been performed on the chamber. The field uniformity data is kept on file at TÜV SÜD Canada. TÜV SÜD Canada Inc. is accredited to ISO 17025 by A2LA with Testing Certificate #2955.02. The laboratory's current scope of accreditation listing can be found as listed on the A2LA website. All measuring equipment is calibrated on an annual or biennial basis as listed for each respective test.

### 6dB Bandwidth of Digitally Modulated Systems

#### **Purpose**

The purpose of this test is to ensure that the bandwidth occupied exceeds a stated minimum. This helps ensure the utilization of the frequency allocation is sufficiently wide. This also helps prevent corruption of data by ensuring adequate data separation to distinguish the reception of the intended information.

#### **Limits and Method**

The limit is as specified in FCC Part 15.247(a)2 and RSS-247 5.2(a).

Systems using digital modulation techniques may operate in the 902 - 928 MHz, 2400 - 2483.5 MHz, and 5725 - 5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz. This should be measured with a 100 kHz RBW and a 300 kHz VBW.

The method is given in FCC KDB 558074 Section 8.1 and ANSI C63.10.

#### Results

The EUT passed.

The minimum 6 dB Bandwidth measured was 683 kHz

The maximum 99% Occupied Bandwidth was 1043 kHz.

### Maximum Peak Envelope Conducted Power

### **Purpose**

The purpose of this test is to ensure that the maximum power conducted to the radiating element does not exceed the limits specified. This ensures that if the end-user replaces the antenna, the maximum power does not exceed an amount which may create an excessive power level.

#### **Limits and Method**

The limits are defined in FCC Part 15.247(b) and RSS-247 5.4(d). For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands, the peak limit is 1 watt (30 dBm).

The method is given in FCC KDB 558074 Section 9.1.2 and ANSI C63.10.

#### **Results**

The EUT passed.

| Output to Pulse SMD antenna                              |      |       |       |  |  |

### Antenna Spurious Conducted Emissions (-20 dBc Requirement)

#### **Purpose**

The purpose of this test is to ensure that the maximum power conducted to the radiating element at frequencies outside of the authorized spectrum does not exceed the limits specified. This ensures that the only the intended signal is delivered to the radiating element.

#### **Limits and Method**

The limits are defined in 15.247(d) and RSS-247 5.5. In any 100 kHz band, the peak spurious harmonics emissions must be at least 20 dB below the fundamental. Spurious Conducted emissions are to be evaluated up to the 10<sup>th</sup> harmonic. This -20 dBc requirement also applies at the 'band edge' or 2.4 GHz and 2.4835 GHz.

The method is given in FCC KDB 558074 Section 11 and ANSI C63.10

#### Results

The EUT passed. Low, middle and high bands were measured. The -20 dBc requirement is shown for the lower band edge at 2.4 GHz in the low band and for the higher band edge at 2.4835 GHz in the high band.

## **Transmitter Spurious Radiated Emissions**

#### **Purpose**

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT does not exceed the limits listed below as defined in the applicable test standard, as measured from a receiving antenna. This helps protect broadcast radio services such as television, FM radio, pagers, cellular telephones, emergency services, and so on, from unwanted interference.

#### **Limits and Method**

The method is as defined in FCC KDB 558074 Section 12.2 and ANSI C63.10.

The limits, as defined in 15.247(d) for unintentional radiated emissions, apply for those emissions that fall in the restricted bands, as defined in Section 15.205(a). These emissions must comply with the radiated emission limits specified in Section 15.209(a).

All unintentional emissions must also meet the 'Spurious Conducted Emissions' requirements of -20 dBc or greater. See also 'Antenna Spurious Conducted Emissions (-20dBc)' for further details.

| Frequency             | Field Strength Limit<br>(μV/m)     | Field Strength at 3m<br>(dBµV/m) |
|-----------------------|------------------------------------|----------------------------------|
| 0.009 MHz – 0.490 MHz | 2400/F(kHz) a (at 300m)            | 128.5 to 93.8a                   |
| 0.490 MHz – 1.705 MHz | 24000/F(kHz) <sup>a</sup> (at 30m) | 73.8 to 63.0 <sup>a</sup>        |
| 1.705 MHz – 30 MHz    | 30ª (at 30m)                       | 69.5ª                            |
| 30 MHz – 88 MHz       | 100a (at 3m)                       | 40.0ª                            |
| 88 MHz – 216 MHz      | 150a (at 3m)                       | 43.5ª                            |
| 216 MHz – 960 MHz     | 200a (at 3m)                       | 46.0ª                            |
| Above 960 MHz         | 500a (at 3m)                       | 54.0ª                            |
| Above 1000 MHz        | 500 <sup>b</sup> (at 3m)           | 54.0 <sup>b</sup>                |
| Above 1000 MHz        | 5 mV/m <sup>c</sup> (at 3m)        | 74.0 <sup>c</sup>                |

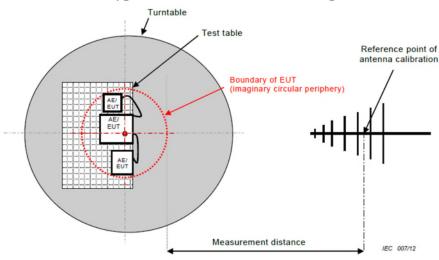

<sup>&</sup>lt;sup>a</sup>Limit is with Quasi Peak detector with bandwidths as defined in CISPR-16-1-1 <sup>b</sup>Limit is with 1 MHz measurement bandwidth and using an Average detector <sup>c</sup>Limit is with 1 MHz measurement bandwidth and using a Peak detector

Based on ANSI C63.4 Section 4.2, if the Peak detector measurements do not exceed the Quasi-Peak limits, where defined, then the EUT is deemed to have passed the requirements.

#### **Typical Radiated Emissions Setup**

## **Measurement Uncertainty**

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is  $\pm 5.67 dB$  for 30 MHz - 1 GHz and  $\pm 4.58 dB$  for 1 GHz - 18 GHz with a 'k=2' coverage factor and a 95% confidence level.

## **Preliminary Graphs**

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector over a full 0-360°. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

In accordance with FCC Part 15, Subpart A, Section 15.33, the device was scanned to the 10<sup>th</sup> harmonic (a minimum of 24.835 GHz).

Devices scanned may be scanned at alternate test distances and in accordance with FCC Part 15, Subpart A, Section 15.31, an extrapolation factor of 20 dB/decade was used above 30 MHz and 40 dB/decade below 30 MHz. For example for 1 meter measurements, an extrapolation factor 9.5 dB from 20 Log (1m / 3m) is applied.

Peak output power for low, middle and high channels and each of the orthogonal axes of the PCB and antennas were checked. The worst case was used for the spurious emissions for each antenna, all of which occurred at low channel.

Band-edge measurement graphs are shown for illustration purposes. See final measurement section for all measurements. Graphs for the worst-case, are presented.

Note: A duty cycle correction factor of -26.23dB (from a duty cycle of 4.88% for the 2.4 GHz transmission) is applied to the high band edges at 2483.5 MHz.

### **Final Measurements and Results**

In accordance with 15.247(d), only frequencies exceeding the 15.209 limit that occur within the bands listed in 15.205 need to be verified with a final detector.

The measurements were maximized by rotating the turn table over a full 0-360 rotation and the antenna height was varied from 1 m to 4 m.

Note: A duty cycle correction factor of -26.23dB (from a duty cycle of 4.88% for the 2.4 GHz transmission) is applied to the high band edges at 2483.5 MHz.

## **Power Spectral Density**

### **Purpose**

The purpose of this test is to ensure that the maximum power spectral density to the radiating element does not exceed the limits specified. This ensures that the modulation is significantly wide enough, or low enough in power that it will allow for co-operation of other wireless devices operating within this frequency allocation.

### **Limits and Method**

The limits are defined in 15.247(e) and RSS-247 5.2(b).

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

The method is given in FCC KDB 558074 Section 10.2.

#### Results

The EUT passed. Low, middle and high bands were measured.

## **Graphs**

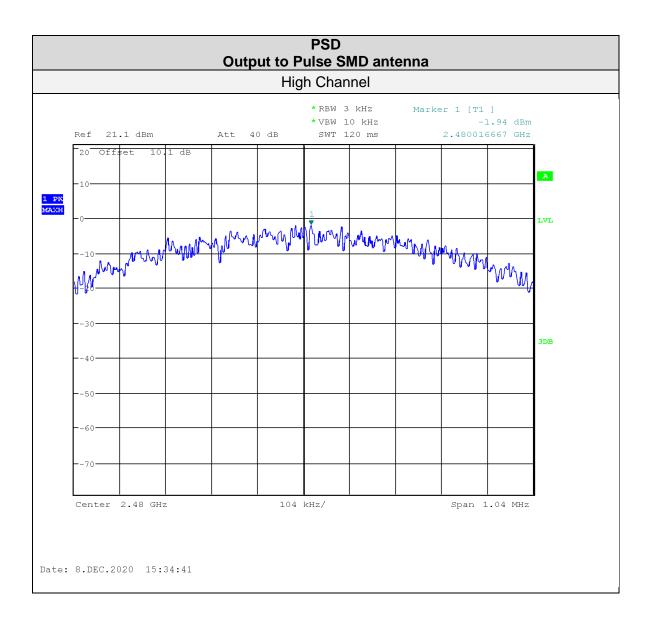

The graphs shown below show the power spectral density of the device during the conducted measurement operation of the EUT. Low, middle, and high channels were investigated. The external attenuator and cable loss are accounted for as reference offset in the spectrum analyzer.

### **Power Line Conducted Emissions**

### **Purpose**

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT's power line does not exceed the limits listed below as defined in the applicable test standard, as measured from a LISN. This helps protect lower frequency radio services such as AM radio, shortwave radio, amateur radio operators, maritime radio, CB radio, and so on, from unwanted interference.

#### **Limits and Method**

The limits are as defined in 47 CFR FCC Part 15 Section 15.207 Method is as defined in ANSI C63.4

| Average Limits    |                | Quasi-Peak        | Limits         |
|-------------------|----------------|-------------------|----------------|
| 150 kHz – 500 kHz | 56 to 46* dBµV | 150 kHz – 500 kHz | 66 to 56* dBµV |
| 500 kHz – 5 MHz   | 46 dBµV        | 500 kHz – 5 MHz   | 56 dBμV        |
| 5 MHz – 30 MHz    | 50 dBμV        | 5 MHz – 30 MHz    | 60 dBμV        |

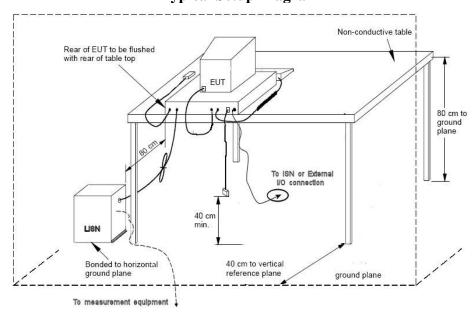

<sup>\*</sup> Decreases linearly with the logarithm of the frequency

Both Quasi-Peak and Average limits are applicable and each is specified as being measured with a resolution bandwidth of 9 kHz. For Quasi-Peak, a video bandwidth at least three times greater than the resolution bandwidth is used.

Based on ANSI C63.4 Section 4.2, if the Peak or Quasi-Peak detector measurements do not exceed the Average limits, then the EUT is deemed to have passed the requirements.

### **Typical Setup Diagram**

## **Measurement Uncertainty**

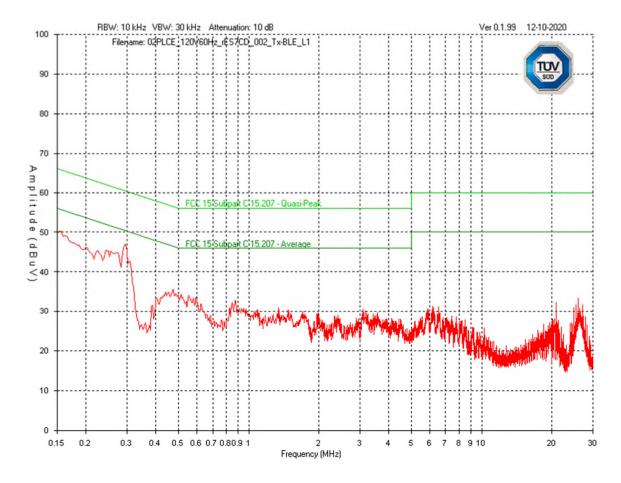

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is  $\pm 2.27 dB$  with a 'k=2' coverage factor and a 95% confidence level.

## **Preliminary Graphs**

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

Average and Quasi-Peak Emissions Table

#### Notes:

Peak = Peak measurement AVG = Average measurement QP = Quasi-Peak measurement

See 'Appendix B - EUT, Peripherals and Test Setup Photos' for photos showing the test set-up.

## **EUT Configuration**

Please see Appendix B for a picture of the unit running in normal conditions.

• Wireless configured to transmit continuously at 100% duty cycle with modulation

Low Channel: Ch 0 = 2402MHz
Middle Channel: Ch 19 = 2440MHz
High Channel: Ch 39 = 2480MHz
Power Level Register Setting: 67

• For the Spurious Radiated Emissions and Power Line Conducted Emissions, the transmitter was set to Ch 0 which was the worst case.

PCB and Antenna configurations for spurious emissions:

| Configuration | РСВА          | Antenna  |  |
|---------------|---------------|--|--|
| 1             | 501-01432-001 | Pulse SMD (122-00067-001)                            |  |
| 2             | 501-01432-024 | Chicago Plenum Dual-Band<br>(122-00060-001) Diplexer |  |
| 3             | 501-01432-024 | Stubby Dual-Band<br>(801-00851-001/2) Diplexer       |  |
