### 1. Electrical Specification :

Those specifications were specially defined for Shenzhen Medica Technology Development Co., Ltd EW202W WIFI model, and

all characteristics were measured under the model's handset testing jig .

# 1-1. Frequency Band:

Frequency Band	MHz
Wi-Fi	2400-2500

## 1-2. Impedance

50 ohm nominal

#### 1-3.Antenna Matching Network

Location	capacitor	Inductor
Shunt 01	N/A	N/A
Series	N/A	N/A
Shunt 02	N/A	N/A

## **2. VSWR**

#### 2-1 Measuring Method

- 1. A 50  $\Omega$  coaxial cable is connected to the antenna. Then this cable is connected to a network analyzer to measure the VSWR,
- 2. Keeping this jig away from metal at least 20cm.

### 2-2 Measurement frequency points and VSWR value

					-
	Frequency (MHz)	2400	2450	2500	
	VSWR	1.70	1.66	1.50	
			A 2.254	AL COMU II II H AL COMU II II H AL COMU II II H AL COMU

## 3. Efficiency and Gain

Measuring instrument: Microwave anechoic chamber, Agilent network analyzer, Agilent spectrum analyzer, 8960 integrated tester, standard antenna.

■ Microwave darkroom instructions:

This is our company's microwave anechoic chamber located in Shenzhen. This microwave anechoic chamber belongs to a far-field measurement system, with a size of 5.0 metersX3.0m x 3.0m, Quietzone size is 15cm x 15cm x 15cm.

图.1. 微波暗室内部仪器设置 r.+

Figure 1 shows the instrument settings in the microwave anechoic chamber and the conn ection diagram of the network analyzer. The distance from the transmitting antenna (0.8-6.0GH Z for GainCalibration) to the antenna to be measured (AUT) is 3.0 meters. The antenna to be m easured is placed on the rotating platform. By controlling the rotating angle of the turntable, th e antenna to be measured can be measured roughly and accurately.

Place the antenna to be tested on a rotating platform and measure the 360 degree field strength data of its various planes (ZY plane and ZX plane). Then, replace the antenna to be tested with a standard dipole antenna and measure its 360 degree field strength data as the standard value for conversion gain. Through the conversion of equation 1, the gain value and d irectional pattern of the antenna to be tested can be obtained.

#### 3-1 Measuring Method

- 1. Using a low loss coaxial cable to link a standard handset jig,
- 2. Fixed this handset jig on chamber's rotator plane,
- 3. Linking jig into network analyzer port and using a probing horn antenna to collect data,
- 4. Using another standard gain horn antenna to calibrated those data.
- 3-2 Efficiency and Gain Value

Frequency (MHz)	Efficiency (%)	Average GAIN (dB)	Peak GAIN (dBi)
2400	68.52	-1.64	4.17
2450	68.90	-1.62	4.60
2490	67.80	-1.69	4.04

3-3 3D Pattern

## 4. Mechanical Specification:

Mechanical Configuration (Unit: mm)

The appearance of the antenna is according to drawing Figure 4-1
