### 3. Test Requirement

## **RF EXPOSURE EVALUATION**

According to § 1.1307(b), § 2.1093, systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)].  $[\sqrt{f_{(GHz)}}] \le 3.0$  for 1-g SAR and  $\le 7.5$  for 10-g extremity SAR,<sup>24</sup> where

- f<sub>(GHz)</sub> is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation<sup>25</sup> .
- The result is rounded to one decimal place for comparison
- . 3.0 and 7.5 are referred to as the numeric thresholds in the step 2 below

The test exclusions are applicable only when the minimum test separation distance is  $\leq 50$  mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation *distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

Routine SAR evaluation refers to that specifically required by §2.1093, using measurements or computer simulation. When routine SAR evaluation is not required, portable transmitters with output power greater than the applicable low threshold require SAR evaluation to guality for TCB approval.

One antenna is available for the EUT. The minimum separation distance is 5mm.

According to ANSI C63.10-2013 9.5 Equations to calculate EIRP Calculate the EIRP from the radiated field strength in the far field using Equation (22): EIRP = E + 20log (d) - 104.7(22)where EIRP is the equivalent isotropically radiated power, in dBm E is the field strength of the emission at the measurement distance, in dBµV/m d is the measurement distance, in m Calculate the EIRP from the conducted power using Equation (23): EIRP = P - G(23)where EIRP is the equivalent isotropically radiated power, in dBm P is the measured power at feedpoint of the EUT antenna, in dBm G is the gain of the EUT radiating element (antenna), in dBi By combining Formula (22) and Formula (23), the result is

 $P = E + 20\log(d) - 104.7 + G$

### 4. Measurement Result

Antenna gain: 0.59 dBi

2468	79.90	-15.2576	-16±1	-15	0.00993579	3

According to KDB 447498, no stand-alone required for antenna, and no simultaneous SAR measurement is required.
